Commuter Rail Service

Proposed Metra STAR Line Service along the EJ&E Rail Line

A.3 Metra STAR Line Background

As described in Section 4.1.7.3 of the Draft EIS, SEA considered the potential effects of the Proposed Action on Metra's ability to implement their proposed STAR Line service on a portion of the EJ&E rail line. Under Metra's plans (1999, 2003, 2007), STAR Line service on the Outer Circumferential Segment (OCS) is proposed to operate on the EJ&E rail line segment between Hoffman Estates near EJ&E MP 42.3, south of the Northwest Tollway/Interstate 90 overpass and Joliet near EJ&E MP 7.2, just south of Renwick Road near Interstate 55. In the Draft EIS, SEA concluded that the Proposed Action would not preclude the implementation of the STAR line service, and that the Proposed Action would not adversely affect potential implementation of the Metra STAR Line Service on the EJ&E rail line.

Based on various comments to the Draft EIS, SEA has conducted a more in-depth analysis of the potential effects that the Proposed Action would have on STAR Line implementation. In order to handle the increased freight train traffic that would result from the Proposed Action, CN has proposed to upgrade and connect existing siding tracks and construct a second main line track to create a 10.1 mile segment of double track (see Figure A.3-1) between the north end of East Siding (MP 21.1) and the south end of Walker Siding (MP 10.9). This increase in track capacity by CN is intended to accommodate solely the additional CN as well as existing EJ&E freight traffic. According to several commenters including Metra, these additional freight trains, along with CN's intention to add this second main line in the EJ&E right-of-way, would be expected to increase the difficulty, costs, and timeline to construct the capacity improvements that would be needed to allow Metra to initiate STAR Line service on the EJ&E segment.

Metra, in their comment letter dated September 29, 2008, stated that these increased costs could adversely affect the STAR Line's cost-benefit standards and potentially jeopardize FTA funding for the STAR Line. Additionally, Metra points out that CN's predecessor railroads were involved with Metra for implementing the North Central Service (Wisconsin Central) and Heritage Corridor Service (Illinois Central) and that CN has been involved with Metra only for ongoing operations on these two routes. Since Metra and CN have never negotiated the initiation of a new Metra service on a CN line, Metra has expressed concern that CN's freight interests could undermine Metra's ability to successfully negotiate the details for STAR Line implementation on the EJ&E. Although Metra had discussions with EJ&E regarding initiation of this service prior to the Application, Metra has not entered into any formal agreements with EJ&E or CN for operating proposed STAR Line trains on the EJ&E.

Metra is preparing an Alternatives Analysis under the Federal Transit Administration (FTA) process. Metra, in a letter dated January 14, 2008, provided SEA with preliminary draft portions of the Metra STAR Line Alternatives Analysis; "Feasible Alternatives: Detailed Descriptions" dated November 13, 2007. Metra also provided SEA with a preliminary weekday passenger train schedule that includes 52 total passenger trains on the EJ&E segment. These trains are proposed to operate on 30 minute peak hour and 60 minute non-peak hour headways. Metra previously completed the Outer Circumferential Commuter Rail

Feasibility Study (T.Y. Lin International 1999) and the STAR Line (Suburban Transit Access Route) Feasibility Study for a Metra Commuter Rail Service System (Metra 2003). Key points provided in these documents have formed the basic framework for SEA's additional analysis.

The Metra Studies identified the capital improvements that would be necessary in order to implement the STAR Line service on the EJ&E under existing conditions. SEA defined these improvements as the Scenario No. 1, or the No Action alternative. To date, none of the Metra Studies include a detailed capacity study (a computer-based dispatch study which models the existing rail corridor with expected freight trains and proposed passenger trains). This capacity study would identify the locations of potential freight and passenger train conflicts and help to confirm the extent of capital improvements that would be needed to safely, efficiently and reliably handle both freight and passenger trains. Typically, a capacity study would be performed by the sponsoring agency (Metra) with the aid of the host railroad at a later stage in the feasibly studies. The results of a capacity study are usually described in terms of average operating speed or delay ratios and, once acceptable levels of these results are agreed upon, form the basis of an agreement between the freight owner and passenger train operator. Should the Board approve the Proposed Action and Metra proceed with the STAR Line development then Metra and CN would ultimately have to agree on a number of operating issues, including a program of capital improvements.

The 2003 Metra Study identified the following improvements that would be required to be implemented to begin STAR Line service as it was envisioned at that time:

- Construct a second mainline track between Crest Hill near Joliet (MP 6.1) and Eola (MP 20.9), including upgrading and incorporating the existing sidings at Walker, Normantown, East Siding and Eola as the second mainline track, with associated crossovers
- Construct a second mainline track between Eola (MP 20.9) to a point just south of West Chicago (MP 28.0)
- Construct a new siding between MP 37.6 and MP 39.1 at Spaulding
- Upgrade the existing mainline track to allow higher speeds
- Upgrade and install a Centralized Traffic Control signaling system with bi-directional signaling
- Upgrade existing at-grade rail/highway crossing surfaces and crossing protection devices
- Construct eight (8) passenger stations with low-level platforms
- Construct a maintenance facility at Hoffman Estates

In this 2003 Study, Metra states that "the ultimate scope and costs of improvements required will be subject to detailed operating analyses and negotiations." The improvements listed in the Study were determined using a "preliminary" schedule to determine the effects of operating EJ&E freight and STAR Line trains on the EJ&E. This preliminary schedule used 30 minute peak service and 60 minute non-peak service headways. These improvements for the initial service were envisioned to allow the joint use of the existing and proposed tracks by both EJ&E freight and Metra commuter passenger trains.

Table 11 of the 2003 Metra Study lists a Summary Opinion of Probable Construction Costs. This summary included capital costs for both the Outer Circumferential Segment on the EJ&E and for the Northwest Corridor Segment (NWCS) along I-90. This summary also included costs for rolling stock, but it did not include costs for right-of-way acquisition, environmental mitigation, or closing/separating any rail highway at-grade crossings. Table A3.1-1 below summarizes the Metra cost information.

TABLE A3.1-1. SUMMARY OPINION OF PROBABLE CONSTRUCTION COSTS FROM METRA 2003 STUDY (2003 DOLLARS)

Item	Opinion of Probable Costs 2003 Dollars	Opinion of Probable Costs Without NWCS and Rolling Stock
Outer Circumferential Segment/EJ&E (OCS) (Joliet to Hoffman Estates on EJ&E: 36 miles, 8 Stations)	$225,000,000	$225,000,000
Connection of EJ&E to NWCS (In Hoffman Estates: 1 Mile, 1 Station)	$38,000,000	Not Included
Northwest Corridor Segment (NWCS) (Hoffman Estates to O'Hare: 18 miles, 8 Stations)	$329,000,000	$38,000,000
Maintenance Facility and Yards	$36,000,000	$36,000,000
SUBTOTAL	$628,000,000	$299,000,000
Contingency: 25 percent of Subtotal	$157,000,000	$75,000,000
Engineering Design/Construction Management: 16 percent of Sum of Subtotal and Contingency	$126,000,000	$60,000,000
Rolling Stock	$192,000,000	Not Included
GRAND TOTAL	$1,103,000,000	$434,000,000

Source: Metra's 2003 STAR Line Report

When these figures are adjusted for inflation at a rate of 5 percent per year for five years, these figures increase to $1,407,000,000 when all items are included and $483,000,000 in terms of 2008 dollars when focused on the elements specified to be implemented along the EJ&E but not considering NWCS-corridor improvements and rolling stock. This $483,000,000 figure includes some project elements that are not included in SEA's analysis. SEA's analysis includes an assumed cost for each of the eight stations and does not include a cost for a Hoffman Estates station on the NWCS.

A.3.1 SEA's Additional Analysis for the Metra STAR Line

As discussed in Section 4.1.5.3 of the Draft EIS, SEA performed three separate and distinct analyses to assess whether CN had sufficient capacity along the EJ&E rail line to handle the expected rail volume. The first analysis was labeled the Bottleneck Analysis which considered all the factors that limit the ability of CN to handle their projected volumes. The second study used a technique known as Line Occupancy Index (LOI) that determined the amount of time each day a particular segment of track is occupied in terms of available minutes. A third test was also conducted by using the Rail Traffic Controller (RTC) model which is an industry-standard dispatching software tool that is used to determine train running times, meeting and passing locations and to help identify infrastructure requirements for a segment of rail line using various different operating scenarios. SEA performed RTC modeling of portions of the CN-EJ&E rail system as part of the Draft EIS analysis.

Following the issuance of the Draft EIS, SEA received numerous comments expressing concern about the EJ&E corridor being able to handle both the traffic levels anticipated by CN as well as the proposed Metra STAR Line service. In response to these comments, additional analysis was conducted to determine whether the EJ&E corridor could accommodate both CN and Metra rail traffic levels.

The additional analysis described below was completed by modifying the rail network that had already been created for the Draft EIS analysis to consider the implementation of Metra STAR Line trains with and without the inclusion of CN's expected traffic volumes. The RTC assumptions listed in the Draft EIS were also applied for this additional analysis.

SEA used the RTC model to examine the operational feasibility of freight trains and Metra passenger trains for various operating scenarios and combinations of infrastructure improvements for the entire STAR Line route on the EJ&E for a 35 mile segment between Hoffman Estates and Joliet. The objective of the additional analysis was to utilize the RTC model to confirm that the Proposed Action would not preclude Metra from initiating the STAR Line service on the EJ&E. The RTC modeling developed workable operating scenarios with associated delay ratios using combinations of infrastructure improvements. With this data, SEA then developed approximate baseline Metra costs for implementing STAR Line service on the existing EJ&E and then considered the incremental Metra implementation costs for additional alternatives that considered the Proposed Action. SEA defined these improvements as the Scenario No. 1, or the No Action alternative. For each scenario, SEA's analysis identified opinions of probable construction cost that would be needed to sustain acceptable levels of freight and passenger train operations.

Using information provided in the Metra documents referenced above, SEA identified four possible capital improvement and operating scenarios under which Metra could implement STAR Line Service. SEA developed Scenarios No. 1, 2, and 3 assuming that freight and passenger trains would or could use the same trackage. The only exception to this assumption is the proposed flyover at West Chicago over the Union Pacific/Metra Line. Metra has indicated that the flyover may be required and would be considered as project planning progresses. SEA assumed that the flyover would be designed with steep gradients to minimize costs, and therefore would be a passenger-train only structure. SEA developed Scenario No. 4 as a "stand-alone" commuter network to be constructed within EJ&E ROW. To date, none of the Metra Studies include a detailed capacity study (a computer-based dispatch study which models the existing rail corridor with expected freight trains and proposed passenger trains). Using the RTC Dispatch Model that SEA developed as part of the verification of the Applicants' operation plan (see Appendix B of the Draft EIS), SEA evaluated the operations of each of the scenarios to determine if the scenario would provide an acceptable level of passenger rail and freight rail service. SEA evaluated the following scenarios for the operation of the STAR Line service. See Figures A3-1 through A3-6.

- Scenario No. 1 – STAR Line base line infrastructure with a second main track between Eola and Walker was evaluated with two different train operating schedules: Scenario No. 1A with STAR Line trains and existing EJ&E trains (no action) and Scenario No. 1B with STAR Line trains and Proposed Action freight trains
- Scenario No. 2 – Infrastructure adds a third main track between Eola and Walker (near Plainfield) to the base line

- Scenario No. 3 – Infrastructure includes a third main track between Walker and Renwick Road to the base line
- Scenario No. 4 – Stand-alone commuter rail was created to analyze a stand-alone option that avoids, to the extent possible, the interference between freight and passenger trains between Hoffman Estates and Renwick Road, and to determine if this stand-alone option could potentially reduce the infrastructure costs

A.3.1.1 RTC Modeling Results

Table A3-2 displays the results of the four Scenarios described above and compares these outputs with the results compiled in the DRAFT EIS (Alternative 4.5), which was rerun to honor the curfew requirement. The Delay Ratio indicates the difference in hours between an unimpeded run as compared to a model run that includes meets and passes, waiting at rail/rail interlockings and trains held to avoid blocking at-grade highway/rail crossings. This difference is expressed in terms of percentage. Another applicable indicator is the average speed derived by the RTC simulation. Freight trains have a maximum operating speed of 45 MPH and passenger trains would be allowed to operate at 79 MPH. The speeds displayed in Table A3-2 include all meets and passes, dwell times at stations, accelerations and deceleration time, permanent slow orders, and slower speeds if a train uses a diverging route. The RTC simulation assumes that yard tracks "absorb" each train upon its arrival, a condition that seldom occurs in real life. The average speed for Metra trains under Scenario 4 indicates that commuter trains would average 44.9 MPH, a relatively high rate of speed with the numerous stations stops enroute.

TABLE A3-2. RTC MODELING

Scenario	Delay Ratio (%)		Average Speed (MPH)	
	CN+EJE	STAR Line	CN+EJE	STAR Line
Proposed Action*	69.7	n/a	23.1	NA**
Scenario 1A	13.0	12.6	20.8	36.2
Scenario 1B	Unacceptable	Unacceptable	Unacceptable	Unacceptable
Scenario 2	40.5	10.5	18.0	35.2
Scenario. 3	38.5	8.0	18.2	25.9
Scenario. 4	NA#	2.6	NA	44.9

* The Draft EIS, Table B4-4 shows this value as 58 percent, SEA recalculated the delay ratio to include the commitment made by the Applicants in voluntary mitigation measure VM 41 related to the operating restrictions imposed by the curfews.

** No STAR Line trains were operated under Proposed Action

Under Scenario 4, CN traffic would be entirely separated from Metra's STAR Line operations.

Scenario No. 2 produced performance results for STAR Line trains roughly comparable to Scenario No. 1A and freight train performance results were better than the Proposed Action. This indicates that Scenarios No. 2 and No. 3 would provide for an acceptable level of service for both passenger and freight trains. Performance results for Alternative No. 3 indicate a slightly better average speed and lowered delay ratio as compared to Alternative No. 2. However, the additional costs do not warrant the very slight benefits provided by Alt. No. 3. Therefore, SEA does not recommend that Alt. No. 3 be pursued. The stand-alone

option, Scenario No. 4 performs without freight train interference and shows the best results for the STAR Line trains.

A.3.1.2 Scenario No. 1: STAR Line with Double Main between Hoffman Estates and Joliet per Metra's 2007 Draft Alternatives Analysis

Scenario No.1 considered the infrastructure improvements identified in Metra's 2007 Draft Alternatives Analysis with the preliminary STAR Line weekday passenger train schedule that includes 52 total passenger trains (see Figures A.3-1 and A.3-3). Two RTC scenarios were modeled with the 52 STAR Line trains sharing trackage with EJ&E trains. Scenario 1A considered STAR Line trains sharing trackage with only current EJ&E freight trains (existing conditions). Scenario 1B considered the full complement of STAR Line trains sharing trackage with CN and EJ&E freight trains that would result from the Proposed Action. Both Scenarios No. 1A and 1B include the following improvements that were identified in the Metra 2007 Draft Alternatives Analysis. These improvements have been based on the fact that, as stated in Metra's 2007 Report, increases in the EJ&E freight train numbers have occurred since the 2003 Metra Study was completed. Due to these increases, Metra has proposed to extend the second mainline for the entire length of the EJ&E STAR Line route as noted above. For purposes of the Scenario No.1 analysis, it was assumed that CN would allow the additional track to be built within EJ&E right-of-way on 15 foot track centers without a transfer of ownership to Metra.

- Construct a second mainline track between a location near Crest Hill at I-55 (Turner - MP 5.5)[1] and Hoffman Estates (MP 42.3), including upgrading and incorporating the existing sidings at Walker, Normantown, East Siding, Eola, and Spaulding as the second mainline track, with associated crossovers
- Upgrade the existing mainline track to allow higher speeds (79 MPH up from 45 MPH)
- Upgrade and install a Centralized Traffic Control signaling system with bi-directional signaling
- Upgrade existing at-grade rail/highway crossing surfaces and crossing protection devices
- Construct eight (8) passenger stations with low-level platforms
- Construct a maintenance facility at a new location in Spaulding (instead of Hoffman Estates as was the case in the 2003 Report)

SEA's Scenario No.1 analysis also included additional features that were not identified in the Metra 2003 Study or the Metra 2007 Draft Alternatives Analysis but were identified to be desirable to consider for the proposed Metra train operations. The Maintenance Facility is slated to be located at a site north of the Metra Milwaukee District West Line at Spaulding and east of the EJ&E Main Track, and north of the proposed Elgin-Bartlett/Spaulding Station

[1] The RTC analysis for Scenario No. 1 is based on double tracking from Turner (MP 5.5) to Renwick Rd. (MP 7.5) to avoid congestion as freight traffic entered the STAR Line corridor and to avoid potential resultant freight delay into the corridor, which would skew the model results. Costs and exhibits reflect double tracking only to Renwick Road, which was identified in previous Metra studies of the Star Line, because this is the portion of costs which would fall onto Metra. The additional two miles of double track from Renwick Road to Turner could potentially be required in the future, based on operational conditions that emerge after STAR Line implementation. As stated previously, the precise capital requirements of STAR Line implementation would be worked out after additional in-depth analysis and negotiation between Metra and CN.

commuter station at MP 38.7. In order to facilitate equipment moves to and from the Maintenance Facility, SEA's analysis included a two track connection at MP 42.3 at Shoe Factory Road just south of the Northwest Tollway/Interstate 90 overpass, plus a dedicated Metra mainline track between MP 42.3 and the Elgin-Bartlett/Spaulding station with a connecting track leading to the Maintenance Facility.

The Metra 2007 Draft Alternatives Analysis states that a grade-separated crossing at West Chicago may be required but would be determined later in the project analysis. Due to the heavy UP freight and Metra West Line passenger traffic at West Chicago, SEA's analysis also included a grade separated crossing that will take a single passenger-only track for Metra STAR Line trains over the UP/Metra West Line tracks at West Chicago. Due to a track gradient of up to 4 percent, this track over UP/Metra was assumed to be used only by Metra STAR Line trains for this analysis.

Station locations for Scenario No. 1 included the eight (8) station locations listed in the 2007 Metra Draft Alternatives Analysis: Elgin-Bartlett/Spaulding Road, West Chicago/North Avenue, West Chicago/Washington Street, Aurora-Warrenville/Butterfield Road, Northwest Naperville, Naperville/95th Street, Plainfield/Van Dyke Road, and Joliet/Renwick Road. The Renwick Road station includes a layover facility with three (3) stub ended tracks. For station locations where there are two main line tracks, SEA assumed that platforms would be located on the outside of each track; center- or island platforms were not considered. For estimating purposes, SEA assumed a lump sum cost of $5,000,000 for each station/park & ride location.

Due to the Federal Transit Administration's level-boarding mandate that nominally requires platform construction within the dynamic clearance envelope of a freight train, SEA's analysis used a gauntlet track at each station platform. A gauntlet track includes two mainline turnouts and an additional pair of rails on longer cross ties that allow the passenger train to switch to the rails that are located closer to the station platform which is outside the clearance envelope of the mainline track. Scenario No.1 includes the use of gauntlet tracks at all stations except West Chicago/Washington Street since this station will be located on a track that would only be used by STAR Line trains near the grade separation at West Chicago. For estimating purposes, SEA assumed a cost of $500,000 for each gauntlet track location.

As part of the Proposed Action, CN has indicated that they will construct a second mainline track between East Siding (MP 21.1) and Walker Siding (MP 10.9), including upgrading and incorporating the existing sidings at Walker, Normantown, and East Siding as the second mainline track. SEA's Scenario No. 1 analysis includes the cost to build this segment of second main line. It is assumed that the cost for the second track as described by CN in their Application would be covered by CN and the cost to install all other trackage and STAR Line stations would be borne by Metra.

SEA performed an operational analysis using RTC for Scenario No.1. The Scenario No. 1 results were inconclusive because the RTC model could not produce a satisfactory result based on the number of conflicts caused by adding both the CN+EJ&E freight trains and the STAR Line service. In other words, SEA determined that Scenario No. 1 would not function adequately with only the infrastructure improvements identified above when considering

Metra STAR Line trains and the CN+EJ&E freight trains that would result from the Proposed Action.

SEA's preliminary opinion of probable construction costs for the infrastructure improvements listed above for both Scenario No. 1 scenarios was determined to be approximately $419 million (2008 dollars) which includes a 25 percent contingency and 16 percent for engineering design and construction management. Table 4.1.2-B contains a summary listing of these costs. This summary includes the costs identified in the Metra 2003 Study for the Maintenance Facility/Yards which has been adjusted up to $46,000,000 in 2008 dollars. This summary does not include costs for the NWCS segment, rolling stock, environmental mitigation, utility relocation, access fees, or operating costs.

SEA considered this figure of $419 million to be the baseline STAR Line cost that was then compared to the costs for the subsequent scenarios that were considered.

A.3.1.3 Scenario No. 2: STAR Line with Double Main between Hoffman Estates and Joliet plus Third Main between East Siding and Walker

Scenario No. 1B was shown to not be feasible operationally when considering CN+EJ&E freight trains and Metra STAR Line trains with the infrastructure identified in the Metra 2007 Draft Alternatives Analysis (see Figure A.3-4). Scenario No. 2 considered additional mainline track construction to provide additional capacity. Scenario No. 2 includes the same CN+EJ&E freight trains and Metra STAR Line trains with essentially the same improvements considered for Scenario No. 1, with the addition of a third mainline track between East Siding at MP 21.0 and Walker at MP 10.3. Again these improvements for the initial service would allow the joint use of the existing and proposed tracks by both freight and passenger trains. For purposes of the Scenario No. 2 analysis, it was again assumed that CN would allow the additional track to be built within EJ&E right-of-way without a transfer of ownership to Metra.

Similar to the analysis for Scenario No. 1, SEA's Scenario No. 2 analysis also included additional features that were not identified in Metra's 2003 Study or the Metra 2007 Draft Alternatives Analysis but were determined to be desirable to consider for the proposed Metra train operations. SEA's Scenario No. 2 analysis included a two track connection at MP 42.3 just south of the Northwest Tollway/Interstate 90 overpass, plus a dedicated Metra mainline track between MP 42.3 and the Maintenance Facility at Spaulding and the Elgin-Bartlett/Spaulding Station. The north limit of the new double track was modified to tie into the south end of the existing Sutton siding at MP 42.2. Due to the heavy UP freight and Metra UP West Line passenger traffic at West Chicago, SEA's Scenario No. 2 analysis also included the same grade-separated crossing for the Metra STAR Line at West Chicago that was included in Scenario No. 1. For estimating purposes, Scenario No. 2 again assumed a lump sum cost of $5,000,000 for each station/parking lot location and $500,000 for each gauntlet track location.

SEA performed an operational analysis using RTC for Scenario No. 2. Based on the results of this analysis, SEA determined that Scenario No. 2 would function adequately with the infrastructure improvements identified above when considering Metra STAR Line trains and the CN+EJ&E trains resulting from the Proposed Action. Delay Ratios of approximately 10 percent for Metra STAR Line trains were also identified. This equates to approximately 2.3

minutes of delay per Metra train. The CN freight delay ratio was calculated to be 44.2 percent, or 61.4 minutes of delay per freight train. This is a relatively high delay ratio, but as identified in the Draft EIS, the initial modeling results of Base Case 4.5 of the original CN Operating Plan without Metra STAR Line trains calculated a freight delay ratio of 47.2 percent, or 64.6 minutes of delay per freight train. Hence Scenario No. 2 has fairly low STAR Line commuter train delays and lower freight delay ratios as compared with the RTC results listed in the Draft EIS analysis. The modeling results indicate that the Proposed Action would not adversely effect the operations of the STAR Line , and conversely that the added infrastructure would not adversely affect the operation of CN's proposed and EJ&E's existing freight traffic.

SEA's preliminary opinion of probable construction costs for the infrastructure improvements listed above for Scenario No. 2 was determined to be approximately $472 million (2008 dollars) which includes a 25 percent contingency and 16 percent for engineering design and construction management. Table 4.1.2-B contains a summary listing of these costs. This summary includes the costs identified in the Metra 2003 Study for the Maintenance Facility/Yards which has been adjusted up to $46 million in 2008 dollars. It should be noted that this summary does include costs for the items described above plus additional right-of-way that is estimated to be required. This summary does not include costs for the NWCS segment, rolling stock, environmental mitigation, utility relocation, access fees, or operating costs.

SEA's preliminary opinion of probable construction cost of $472 million for Scenario No. 2 represents approximately a 2.3 percent increase above the baseline Scenario No. 1 cost of $419 million. As part of the Proposed Action, CN has proposed to construct a second mainline track between East Siding (MP 21.1) and Walker Siding (MP 11.0), including upgrading and incorporating the existing sidings at Walker, Normantown, and East Siding as the second mainline track. The incremental cost between Scenarios No. 1 and No. 2 is essentially the cost to build this segment of additional main line track. It could be argued that, since CN has proposed to build this segment of additional main line track at their cost even without the STAR Line, there should be no incremental cost increase to Metra to implement Scenario No. 2 rather than Scenario No. 1.

A.3.1.4 Scenario No. 3: STAR Line with Double Main between Hoffman Estates and East Siding plus Third Main between East Siding and Joliet

Scenario No. 3 considered adding mainline trackage to provide additional capacity (see Figure A.3-5). Scenario No. 3 includes the same CN+EJ&E freight trains and Metra STAR Line trains with essentially the same improvements included for Scenario No. 2, with a third mainline track extended from Walker at MP 10.3 south to just north of Renwick Road at MP 7.7. These capacity improvements would allow the joint use of the existing and proposed tracks by both freight and passenger trains. For purposes of the Scenario No. 2 analysis, it was again assumed that CN would allow the additional track to be built within EJ&E right-of-way without a transfer of ownership to Metra.

Similar to the analyses for Scenarios No. 1 and No. 2, SEA's Scenario No. 3 analysis also included additional features that were not identified in Metra's 2003 Study or the Metra 2007

Draft Alternatives Analysis but were determined to be desirable for inclusion for the proposed Metra train operations. SEA's Scenario No. 3 analysis included a two track connection at MP 42.3 just south of the Northwest Tollway/Interstate 90 overpass, plus a dedicated Metra mainline track between MP 42.3 and the Maintenance Facility and Elgin-Bartlett/Spaulding station. The north limit of the new double track was modified to tie into the south end of the existing Sutton siding at MP 42.2. Due to the heavy UP freight and Metra West Line passenger traffic at West Chicago, SEA's Scenario No. 3 analysis also included the same grade-separated crossing for the Metra STAR Line at West Chicago that was included in Scenarios No. 1 and No. 2. For estimating purposes, Scenario No. 3 again assumed a cost of $5,000,000 for each station/park & ride location and $500,000 for each gauntlet track location.

SEA performed an operational analysis using RTC for Scenario No. 3. Scenario No. 3 differed from Scenario No. 2 by the addition of a segment of double track between Walker through Plainfield, the Lake Renwick area to the end of the STAR Line service near Renwick Road. While a slight improvement in overall average speed (18.2 MPH up from 18.0 MPH) and a reduction in delay ratio (38.5% down from 40.5%) were noted, these results do not likely justify the increase in cost of approximately $27.9 million.

SEA's preliminary opinion of probable construction costs for the infrastructure improvements listed above for Scenario No. 3 was determined to be approximately $500 million (2008 dollars) which includes a 25 percent contingency and 16 percent for engineering design and construction management. Table 4.1.2-B contains a summary listing of these costs. This summary includes the costs identified in the Metra 2003 Study for the Maintenance Facility/Yards which has been adjusted up to $46,000,000 in 2008 dollars. It should be noted that this summary does include costs for the items described above plus additional right-of-way that is estimated to be required. This summary does not include costs for the NWCS segment, rolling stock, environmental mitigation, utility relocation, access fees, or operating costs.

SEA's preliminary opinion of probable construction cost of $500 million for Scenario No. 3 represents approximately an 8.9 percent increase above the baseline Scenario No. 1 cost of $419 million.

A.3.1.5 Scenario No. 4: Stand-Alone Option - STAR Line with CN Double Main between East Siding and Walker plus Exclusive Metra Main between Hoffman Estates and Joliet

Metra has envisioned the STAR Line to operate in mixed use with freight traffic similar to how Metra operates on all other diesel-operated service corridors in the Chicago area (see Figure A.3-6). As an alternative to a mixed freight-passenger corridor on the EJ&E, SEA considered the 52 daily STAR Line trains using a dedicated passenger-only Metra main line track located on the east side of the EJ&E corridor between Joliet (MP 7.5) and Hoffman Estates (MP 42.5). A dedicated main track for the STAR Line would allow Metra trains to operate independent of the CN+EJ&E trains. Under Scenario No. 4, Metra would purchase a 20 foot-wide swath on the east side at the outer edge of the EJ&E right-of-way between MP 42.5 and MP 7.5 and would then install a single track commuter network within this swath. At some locations where the right-of-way is limited by topographic features and

locations where passing tracks and stations would be required for Metra trains to meet opposing Metra trains and for passenger stations and park & rides, additional property would need to be acquired as needed outside the EJ&E right-of-way. The cost for this property acquisition has not been estimated. Due to the heavy UP freight and Metra UP West Line passenger traffic at West Chicago, SEA's Scenario No. 4 analysis also included the same grade-separated crossing for the Metra STAR Line at West Chicago that was included in the previous Scenarios. Because Metra would enter the EJ&E on the east side of the right-of-way at MP 42.5 and exit the EJ&E right-of-way on the west side at MP 7.5, a grade-separated flyover has been assumed just north of the Joliet/Renwick Road station.

The advantages to operating a stand-alone commuter network within the EJ&E ROW include:

- Metra could control their own operation which includes the ability to add, subtract or modify commuter service on an as-needed basis.
- Metra could also realize lower liability insurance premiums for independent rather than co-mingled or shared service.
- Track Access Fees would be eliminated.
- Metra could avoid the installation of gauntlet tracks at station locations.
- If desired, Metra could operate non-compliant vehicles.
- Signal spacing could be tailored for optimal commuter train operation. Developing a wayside signal system that provides for the save operation of two-mile long freight trains operating at 40-45 MPH combined with 500 foot long commuter trains operating at 79 MPH can be difficult and expensive.

Since this Metra track would be independent of the CN+EJ&E trackage, Scenario 4 does not include upgrading the CN+EJ&E trackage and signal system. A new Centralized Traffic Control signaling system with bi-directional signaling would be installed for the Metra track and would include locations where CN+EJ&E trains would need to cross the Metra main line to service industries located on the east side of the right-of-way. CN could serve these industries at night to minimize interference with STAR line commuter trains.

Since only Metra STAR Line trains would operate on this dedicated main line track, mid or high level platforms could be used to accomplish level boarding. For estimating purposes, Scenario No. 4 again assumed a cost of $5,000,000 for each of the eight station/park & ride locations, but the cost of gauntlet tracks was not included.

In order for the dedicated Metra track to not be considered an adjacent track for maintenance purposes, the centerline of the Metra track would need to be located a minimum of 25 feet from the centerline of the closest CN track. This separation allows either railroad to perform maintenance tasks independent of and without contacting the other railroad. Since this 25-foot separation is greater than the usual 15-foot track centers, additional right-of-way would need to be acquired because the grading footprint for the new Metra track would likely be off the existing right-of-way at more locations for Scenario No. 4 than for Scenarios No. 1 through No. 3.

SEA's preliminary opinion of probable construction costs for the infrastructure improvements listed above for Scenario No. 4 was determined to be approximately $499.7

million (2008 dollars) which includes a 25 percent contingency and 16 percent for engineering design and construction management. Table A3-3 contains a summary listing of these costs. This summary includes the costs identified in the Metra 2003 Study for the Maintenance Facility/Yards which has been adjusted up to $46,000,000 in 2008 dollars. It should be noted that this summary does include costs for the items described above plus additional right-of-way that is estimated to be required. Because the stand-alone alternative will be free and clear of CN's track infrastructure, the improvements that CN is planning to improve capacity along the EJ&E will not provide a benefit to Scenario No.4. This summary does not include costs for the NWCS segment, rolling stock, environmental mitigation, utility relocation, access fees, or operating costs.

SEA's preliminary opinion of probable construction cost of $499.7 million for Scenario No. 4 represents approximately a 19.3 percent increase above the baseline Scenario No. 1 cost of $419 million.

TABLE A3-3. OPINION OF PROBABLE CONSTRUCTION COSTS FOR SCENARIOS 1 THROUGH 4 (2008 DOLLARS)

Item	Scenario No. 1	Scenario No. 2	Scenario No. 3	Scenario No. 4
Track (Ballast, Ties, Rail & OTM)	$40,627,900	$53,333,500	$57,157,900	$57,194,000
Track Rehabilitation	$20,282,760	$20,282,760	$20,282,760	$0
Remove Track	$948,250	$918,200	$931,250	$186,300
Remove Turnout (s)	$440,000	$440,000	$460,000	$0
Add Track @ Diamond Crossing	$450,000	$600,000	$600,000	$1,650,000
Turnouts:				
New #10 (Hand Throw)	$2,100,000	$2,100,000	$2,300,000	$600,000
New #15 (Power Operated)	$300,000	$300,000	$300,000	$0
New #20 (Power Operated)	$9,800,000	$11,800,000	$12,800,000	$2,000,000
Gauntlet Tracks	$3,500,000	$3,500,000	$3,500,000	$0
Drainage & Erosion Control	$15,500,000	$20,000,000	$21,500,000	$21,500,000
Railroad Bridges/Underpasses	$16,695,000	$18,300,000	$23,580,000	$17,400,000
Railroad Flyovers:				
West Chicago	$15,225,000	$15,225,000	$15,225,000	$16,425,000
Renwick Rd.	$0	$0	$0	$9,900,000
Modifications to Existing Highway Overpasses	$1,682,500	$1,682,500	$1,682,500	$7,003,750
New Grade Crossing (Surfaces and Track)	$1,387,200	$1,789,600	$2,032,800	$1,215,200
Embankment (Assumed 68 SF/TF)	$12,029,396	$15,819,596	$16,925,850	$42,029,307
Mechanically Stabilized Earth (MSE Wall) for Flyovers	$0	$0	$3,625,000	$7,125,000
Right-of-Way	$16,500,000	$24,900,000	$26,400,000	$34,800,000
Train Control Signals	$45,500,000	$48,800,000	$49,700,000	$39,600,000
Stations	$40,000,000	$40,000,000	$40,000,000	$40,000,000
Maintenance Facilities and Yards	$46,000,000	$46,000,000	$46,000,000	$46,000,000
SUBTOTAL	**$288,968,006**	**$325,791,156**	**$345,003,060**	**$344,628,557**
Contingency	$72,242,002	$81,447,789	$86,250,765	$86,157,139
Design / Construction Management	$57,793,601	$65,158,231	$69,000,612	$68,925,711

TOTAL PROJECT COST	$419,003,609	$472,397,176	$500,254,437	$499,711,407
Less Work Completed By CN		$43,871,645	$43,871,645	
Net Project Costs (to Metra)		$428,525,530	$456,382,792	$499,711,407
INCREMENTAL COST Above Scenario No. 1 ($)		$9,521,921	$37,379,182	$80,707,798
INCREMENTAL COST Above Scenario No. 1 (percent)		2%	9%	20%

A.3.2 Summary of SEA's Additional Analysis for the Metra STAR Line

Table A3-4 contains a summary listing of the capital costs for Scenarios No. 1 through No. 4 including the incremental capital costs to implement each of Scenarios No. 2 through No.4 over and above the cost of Scenario No. 1 for the EJ&E segment. SEA's analysis shows that the cost to Metra to implement the STAR Line will be greater if the Proposed Action is approved. The percent ranges of the incremental increases are within reasonable ranges given the project complexities and factors that can only be more accurately identified through further detailed analysis. Since SEA did not include costs for the NWCS or for rolling stock, these percentages would be even lower if considered as a percentage of the overall cost to implement the entire STAR line project. CN has indicated that they will construct approximately ten miles of double track. If this double track construction occurs, Metra's cost for Scenarios 2 and 3 's could be reduced accordingly. SEA has estimated that the probable construction costs for the double track segment between East Siding and Walker that includes connecting the existing sidings at East Siding, Normantown and Walker would be approximately $43.9 million. This cost may be higher than ultimately estimated by CN as SEA's estimate includes several universal interlockings between East Siding and Walker than were not included in CN's original estimate.

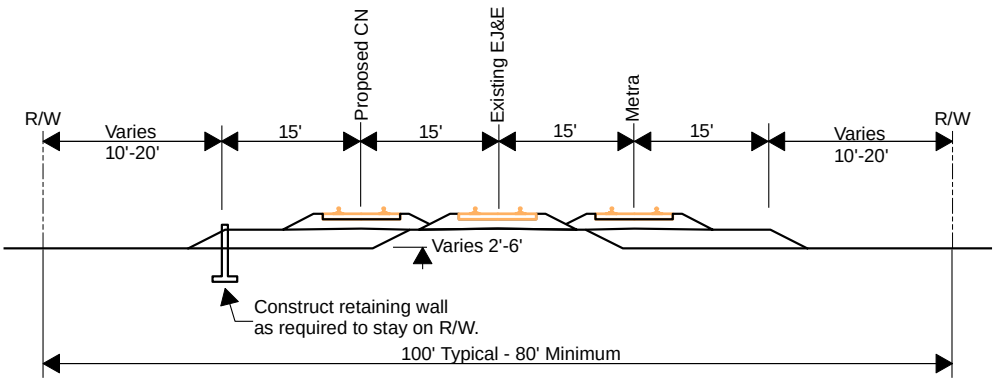

TABLE A3-4. SUMMARY COMPARISON OF OPINION OF PROBABLE CONSTRUCTION COSTS FOR SCENARIOS NO. 1 THROUGH NO. 4 (2008 DOLLARS)

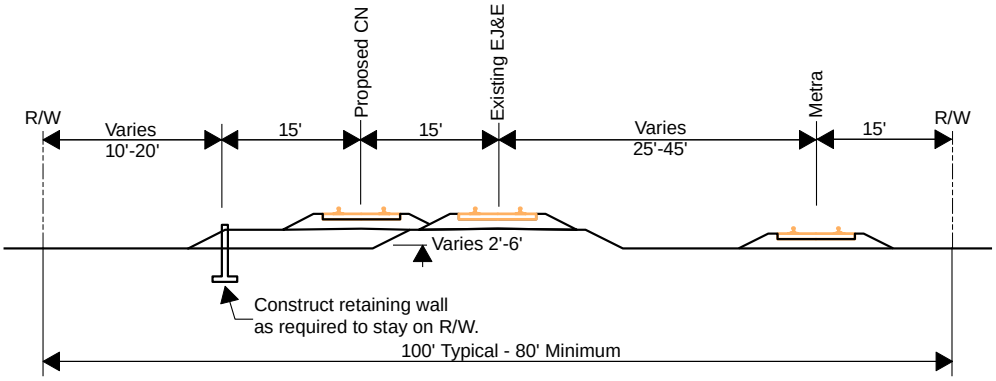
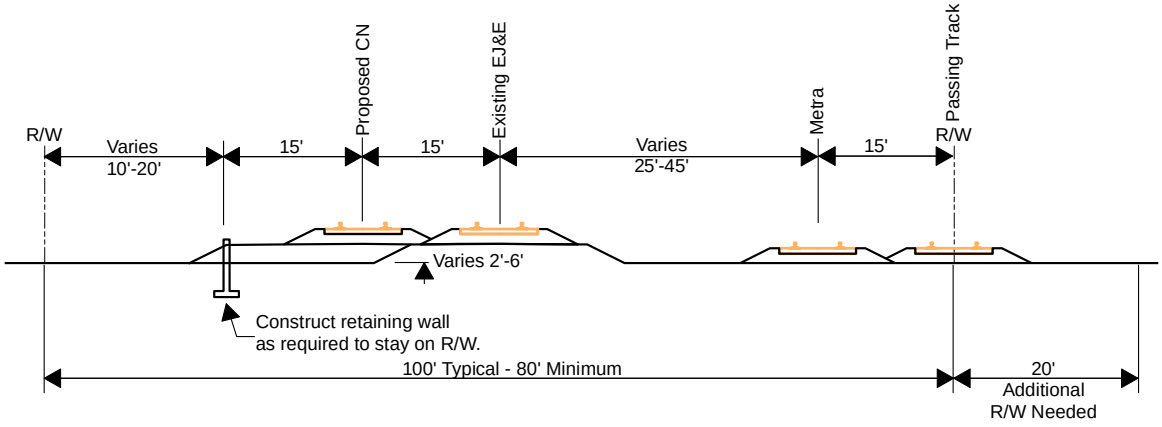
	Scenario No. 1	Scenario No. 2	Scenario No. 3	Scenario No. 4
Total Project Cost	**$419,003,609**	**$472,397,176**	**$500,254,437**	**$499,711,407**
Incremental Cost Above Scenario No. 1 ($)		$53,393,567	$81,250,828	$80,707,798
Incremental Cost Above Scenario No. 1 (percent)		13 percent	20 percent	19 percent
LESS WORK COMPLETED BY CN		$43,871,645	$43,871,645	
NET PROJECT COSTS (TO METRA)		$428,525,530	$456,382,792	
INCREMENTAL COST Above Scenario No. 1 ($)		$9,521,921	$37,379,182	
INCREMENTAL COST Above Scenario No. 1 (percent)		2 %	9 %	



A major consideration when discussing STAR Line implementation is the speculative nature of determining costs for additional right-of-way. SEA's analysis identified costs per acre that were used uniformly but these costs in reality could vary widely per location. Scenario No. 4 has relatively low capital costs but would likely require the most right-of-way to implement. SEA also did not consider potential utility relocation for the additional analysis due to the

limited information available, but these costs would also become factors in determining overall implementation costs.



In conclusion, SEA determined that implementation of the STAR Line would still be physically possible and operationally feasible if the Proposed Action is approved. SEA acknowledges that the Proposed Action would increase the cost and difficulty to implement the STAR Line but would not preclude it.

Ms. Victoria J. Rutson
Chief, Section of Environmental Analysis
Surface Transportation Board
1925 K Street NW
Washington, DC 20423

Re: Canadian National Railway Safety Integration Plan, Finance Docket No. 35087

Dear Ms. Rutson:

Pursuant to applicable regulations, the Federal Railroad Administration (FRA) hereby submits its findings and conclusions on the Safety Integration Plan (SIP) prepared for the proposed Canadian National Railway Company and Grand Trunk Corporation (CN) acquisition of the Elgin, Joliet and Eastern West Company (EJ&EW) (as per Title 49 Code of Federal Regulations (CFR) Section 244.17).

On December 28, 2007, CN filed its initial SIP with FRA and the Surface Transportation Board (STB) detailing the process and timetable for the merger of its operations with those of the EJ&EW. Subsequent discussions between FRA and CN resulted in CN submitting a revised SIP by letter dated June 27, 2008.

After careful review of the revised SIP, FRA finds that CN has adequately addressed the concerns FRA raised regarding the original SIP, and FRA finds that CN has now satisfactorily addressed each of the SIP elements required as per 49 CFR § 244.13.

Assuming that CN's acquisition of EJ&EW is approved, FRA will monitor CN's implementation of the SIP during the operations integration period. In accordance with regulatory requirements, FRA will also consult with the STB at all appropriate stages of implementation and will advise the STB of CN's status implementing the SIP, as appropriate. (See 49 CFR § 244.17(g).)

Finally, FRA supports adoption of the standard relevant conditions in rail merger cases, i.e., requiring the merging carriers to comply with the final SIP and to continue to

coordinate with FRA during the implementation of the transaction. (See, for example, Draft Environmental Impact Statement at ES-35).

Sincerely,

Joseph H. Boardman
Administrator

A.4 Canadian National Safety Record

CN's Safety Record in Canada

Several commenters on the Draft EIS expressed concerns about CN's safety record in Canada. This section provides an overview of Canada's rail safety regulations and CN's safety performance.

Transport Canada (TC), a department of the Canadian federal government, has jurisdiction over federally certified railways in Canada. TC reports to the Minister of Transport. A number of short lines operating solely within individual provinces fall within provincial jurisdiction; steps have been taken to harmonize federal and provincial regulation of railways under their respective jurisdictions.

A number of pieces of legislation cover the operation of federal railways in Canada, including;

- Canada Transportation Act
- Railway Safety Act
- Transportation of Dangerous Goods Act
- Canadian Transportation Accident Investigation and Safety Board Act
- Railway Relocation and Crossing Act

Two separate branches within Transport Canada have responsibility for implementing, monitoring and administering rail safety: the Rail Safety Directorate, and the Transport of Dangerous Goods Directorate (the latter has responsibility for handling and transportation of dangerous commodities by all modes).

The independent Transportation Safety Board of Canada (TSBC) conducts independent accident investigations for all transportation modes under federal jurisdiction, makes findings as to cause and contributing factors, identifies safety deficiencies, makes recommendations and reports publicly. TSBC regulations require accidents and incidents be reported to it, and establishes standards for reporting. The TSBC reports directly to the Privy Council.

The Canadian Transportation Agency (CTA) is an independent, quasi-judicial tribunal reporting to Parliament through the Minister of Transport. The CTA deals mainly with issues of economic regulation, market-entry and dispute resolution for all transport modes under federal jurisdiction. Although the CTA is responsible for issuing the Certificate of Fitness required for the operation of a railway company, it otherwise has a limited role in rail safety related mainly to level crossing issues, right of access to owners of adjoining land, and noise.

Comparison with the United States

The role of Transport Canada with respect to rail, particularly the role of the Rail Safety Directorate, is largely vested with the Federal Railroad Administration (FRA) in the US. The Transportation Safety Board of Canada acts similarly to the National Transportation Safety Board in the US. The Canadian Transportation Agency's role is largely filled by Surface Transportation Board in the US.

A.3.3 Rulemaking under the Railway Safety Act

Rulemaking in Canada under the *Railway Safety Act* (RSA) is largely a voluntary and consultative, rather than a prescriptive and directory, process. TC envisions the regulatory process as being performance-based. The Minister, however, has peremptory and definitive power under the RSA to order a railway company to formulate or revise its rules on any matter involving rail safety, and may impose rules directly.

FRA regulations are more prescriptive with little room for flexibility. While there has been discussion within the industry in the US about risk and performance based regulations, there has been little progress to date.

A.3.4 Background on Current Concerns about Rail Safety in Canada

The RSA was implemented in 1989 during a period of significant change in rail transportation in Canada – government deregulation, industry privatization and restructuring. The two Class I Railroads in Canada, the CN and CPR, closed many unprofitable lines and transferred others to newly created short lines. CN was privatized in 1995 and CPR completely reorganized and moved its headquarters from Montreal to Calgary in 1996.

The RSA reflected a move from a fully prescriptive regulatory approach to a co-operative relationship where Transport Canada retained overall responsibility for safety. After a mandated review in 1994, the RSA was amended in 1999, whereby each railway was required to develop and implement a safety management system (SMS). The SMS approach is neither deregulation nor industry self-regulation, but partnering between the industry and the regulator to better manage risks and continuously improve safety performance. The SMS approach remains in effect today.

From the mid-1990's through 2002, railway accidents in Canada declined. The trend reversed from 2003 through 2005, during which time there were a number of high-profile accidents. Although the number of accidents fell off again in 2006, the Minister of Transport, Infrastructure and Communities, under pressure from the media, the public, federal opposition parties, provincial governments and rail unions, initiated the *Railway Safety Act* Review in December, 2006. A Review Advisory Panel was appointed by the Minister in February 2007. The Minister tabled the Panel's report entitled *Stronger Ties: A Shared Commitment to Railway Safety – Report of the Railway Safety Act Advisory Panel* in the House of Commons on March 7, 2008.

The House of Commons' Standing Committee on Transport, Infrastructure and Communities commenced its own review of rail safety in October 2006 (2 months before the Minister announced his review) and issued a report on May 29, 2008 which largely endorsed the finding of the Advisory Review Panel while adding a few recommendations of its own.

A.3.5 CN's Safety Record in Canada

CN and CPR have both suffered a number of high – profile accidents over the last few years. In its Introduction, the Advisory Panel makes specific reference to accidents at Cheakamus Canyon BC, Lillooet BC and Montmagny, Quebec, all involving CN. And in the body of its Report, the Panel compares accidents at Cheakamus and Wabamun, Alberta, other locations on CN.

The specifics of the accidents at the four CN locations are as follows:

Wabamun: On August 3, 2005, a CN freight train, proceeding westward from Edmonton, Alberta to Vancouver B.C., derailed 43 cars, including 1 loaded car of pole treating oil, 1 car of toluene, and 25 cars of Bunker C (heavy fuel oil) at Mile 49.4 of the Edson Subdivision near Wabamun, Alberta. Approximately 700,000 litres of Bunker C and 88,000 litres of pole treating oil were spilled causing extensive property, environmental, and biological damage in and adjacent to Lake Wabamun. About 20 people were evacuated from the immediate area. There were no injuries.

Cheakamus: On August 5, 2005, a CN freight train, proceeding northward from Squamish to Lillooet, B.C., derailed nine cars including one of sodium hydroxide (caustic soda) and eight empties at Mile 56.6 of the Squamish Subdivision near Garibaldi, B.C.

Approximately 40,000 litres of caustic soda spilled into the Cheakamus River, causing extensive environmental damage. There were no injuries.

Montmagny: The Transportation Safety Board investigated four accidents, which took place on CN's Montmagny Subdivision in 2002, 2003 and 2004. These were:

On July 22, 2002, 52 cars, 51 of which were empty tank cars which had recently held fuel oil and gasoline, derailed and rolled over while being switched in Joffre Yard at Levis, Quebec, Mile 115.2 of the Montmagny Subdivision. Two switches and 3600 feet of track were damaged. There were no injuries.

On January 20, 2003, an eastbound CN freight train collided with a Hi-rail vehicle at Mile 97.60 of the Montmagny Subdivision, near St. Charles, Quebec. The Hi-rail vehicle was destroyed and the lead locomotive slightly damaged. There were no injuries.

On February 7, 2004, a westbound CN freight train derailed 27 freight cars, including a pressure tank car loaded with chlorine at Mile 77.8 of the Montmagny Subdivision in the city of Montmagny, Quebec. Approximately 1500 feet of track and two public crossings were damaged. Three spans of the railway bridge over the Du Sud River were destroyed, and the remaining six spans were damaged. There was no release of dangerous goods and no-one was injured.

On November 12, 2004, 10 multi – platform container cars of an eastbound CN freight train derailed at Mile 114.8 of the Montmagny Subdivision, near Levis, Quebec. The cars sustained minor damage, and two switches and 500 metres of track were damaged. No dangerous goods were spilled and there were no injuries.

On June 29, 2006, a CN locomotive and lumber car derailed approximately 40 kilometres north of Lillooet B.C. Two CN employees were killed and a third injured. The locomotive and car were destroyed.

While rulemaking in Canada under the *Railway Safety Act* is a consultative and cooperative rather than a prescriptive and directory process, the Minister has peremptory and definitive power under the RSA to order a railway company to formulate or revise its rules on any matter involving rail safety, and may impose rules directly. Transport Canada, acting on behalf of the Minister, has used this authority on several occasions to issue orders affecting

CN operations, particularly on the former BC Rail property acquired by CN in 2004. Transport Canada also carried out a detailed audit of CN's safety management system.

A.3.5.1 Canadian Rail Safety Statistics

- The Panel analyzed accidents reported to the Transportation Safety Board of Canada (TSBC) since the RSA was implemented in 1989 through 2006 and found two periods during which accidents increased, 1992-1996 and 2002-2005.
- The first increase was attributed to a change in reporting requirements, which started in 1992 and not fully implemented until 1994. The turmoil associated with the privatization of CN in 1995 and CPR's reorganization and move of headquarters to Calgary likely also contributed, as did the severe winter weather in the middle of the decade.
- The Panel noted that the sale of lightly used (and therefore less well-maintained) federal lines to provincial railways may have contributed to the reduction of accidents between 1997 and 2002. Similarly, CN's 2004 acquisition of previously provincially – regulated BC Rail increased the size of the federally regulated network for which accident statistics were reported. Also, the mountainous nature of BC Rail likely contributes to higher preponderance of accidents. Many of the accidents CN experienced between 2004 and 2006 occurred on BC Rail.

The Panel found:

- Main track accidents accounted for only 12.2 percent of all accidents in 2006, and 66 percent of these involved 5 cars or less. The Panel focused heavily on main track accidents, however, as these have the greatest potential for catastrophic impact. Also, while infrequent, total main track accidents increased between 2002 and 2005, then fell in 2006.
- Non main track accidents accounted for 52.8 percent of all accidents in 2006. These also increased from 2002 to 2005.
- Crossing accidents accounted for 23.6 percent of the total in 2006, and have fallen substantially since 1989. Trespasser accidents accounted for 2.8 percent of the total in 2006 and have remained fairly constant over the period. Crossing and trespasser accidents are the cause of most railway fatalities and serious injuries, responsible for 87 percent (142 people) of the total in 2006.
- While transportation of dangerous goods on CN and CPR increased by approximately 60 percent between 1997 and 2006, reportable accidents and incidents fell dramatically.

A.3.5.2 Comparison of Canadian and U.S. Reporting Criteria

What constitute railway reportable "accidents" and "incidents" in Canada are very different from those in the U.S.; further the word "accident" has a very different meaning in Canada than in the U.S. Therefore what are counted as accidents in the two countries are not the same and cannot be compared.

What constitutes an "accident" in Canada is far more encompassing. To emphasize this point, data provided by the TSBC for the years 2005 and 2006, showing TSB reportable accidents compared to accidents which would have been reported had the FRA methodology been used, is shown in the following table:

Numbers of TSB Reportable Accidents and Accidents Indicated as FRA Reportable				
	2005		2006	
	CTSB Reportable Accidents	Accidents Indicated as FRA Reportable	Accident Type	Accidents Indicated as FRA Reportable
Main track Collisions & Derailments	200	71	137	33
All other	1,047	55	1,006	34
Total	**1,247**	**126**	**1,143**	**67**

Source: Joseph F. Schulman, CPCS Transcom Limited, *The State of Rail Safety in Canada* (August 2007), p. 29, Figure 7.1 (see Appendix C)

A.3.5.3 Comparison of Canada/U.S. Rail Safety Records

Using conversion data like that above provided by both CPR and CN, a comparison can be made of the Canadian railways with their Class I counterparts in the U.S. and draw the following conclusions:

- CN's performance since 1996, its first year following privatization, has been consistently better.
- CN's and CPR's accident rates per million train miles for their combined Canadian and U.S. operations averaged over the entire period 1996 – 2006 are 2.2 and 2.4 respectively. This compares favorably with the averages of the four largest U.S. railways, which range between 2.8 and 4.4, and the overall U.S. Class 1 (does not include Canadian operations of CN and CPR) average of 3.9 per million train miles for the same period
- CN's average for its U.S. operations alone is 5.4, higher than the U.S. Class 1 average. CPR's
- CN's and CPR's safety records in Canada are better than those achieved in the U.S.

A.3.5.4 Panel's Conclusions and Recommendations

The Panel concluded "the safety record of Canada's major railways (CN and CPR) is among the best in North America". It also found that "the RSA and its principals are fundamentally sound" and indicated it "supported the SMS approach to managing railway safety." It stressed, however, the upward trend of main track accidents must be addressed, and improvements made to reduce accidents in yards and on railway spurs.

The Panel went on to make 56 recommendations. Only five of these dealt with operational issues. The bulk of the recommendations relate to governance, regulatory framework, the nature of safety management systems, information collection, analysis and dissemination,

proximity issues, environmental protection and response, scientific and technological innovation, resources, and relationships.

A.3.5.5 Harmonization of Rail Operations and Safety between Canada and the US

CN's activities in the US are governed by US and not Canadian laws and regulations. Even so there may be some concern that CN, as a company headquartered in Canada, is somehow different from the US based Class 1 roads. The following information is intended to allay concerns.

- Rail Safety Directorate senior officers hold confidential meetings with their FRA counterparts each spring and fall. Representatives of both organizations feel cross - border harmonization on rail safety is very good.
- The Railroad Safety Advisory Committee comprised of all North American railways and their unions as well as both Canadian and American regulators meet quarterly.
- Harmonization is expected to be furthered by railway associations and regulators working out problems one by one, rather than by formal structure. A number of factors contribute to this belief:
    - Harmonization is necessary for unimpeded flow of trade
    - The Rail industry has a 140-year history of close integration.
    - Canadian and U.S. railways operate in each other's countries.
    - Canadian railways see themselves as North American carriers with a mindset that operationally, the border does not exist.
    - Industry has always interchanged traffic, necessitating harmonization.
    - Industry is highly organized with associations, supplier groups and other bodies that have created standards and procedures that permeate day-to-day life.
    - Industry draws on common pool of equipment suppliers.

A.5 Transportation Systems

Current and Regional Mobility

Village of Barrington Traffic Operations Analysis

Table A.5-1 Total Vehicle Traffic and Percent Increase

A.5 Current and Regional Mobility

Appendix A Transportation Current and 2015 Regional Mobility

Current Regional Mobility

Section 3.3 of the Draft EIS discussed the existing local and regional highway systems, emergency vehicle services, navigation, and airports. To update current regional mobility conditions, SEA used updated ADTs to conduct additional analyses of crossing LOS and queue lengths. The results of SEA's additional analyses assessing current regional mobility factors are described below.

EJ&E Rail Line

SEA used updated ADT's and train operation data, including increased train speeds at some locations, to reassess potential effects of the Proposed Action on mobility within affected communities and the region. SEA's additional analyses resulted in several changes in Levels of Service (LOS) for roadways that cross the EJ&E rail line. The LOS refers to the efficiency at which a roadway, intersection, or highway/rail at-grade crossing operates and is a reflection of vehicle delay and congestion. LOS is one of the measurements planning agencies use to assess regional mobility. Based on SEA's additional analyses, the LOS for some affected roadways that cross the EJ&E declined but most improved. Table 2.5-2, below, (published in the Draft EIS with SEA's original results as Table 3.3-3) summarizes the changes in LOS that SEA identified.

Table A3-1. 2007 LOS Summary of Roadways Crossing the EJ&E Railway

LOS	Total	Lake (Illinois)	Cook (Illinois)	DuPage (Illinois)	Will (Illinois)	Lake (Indiana)
LOS A - B	54	10	12	5	21	6
LOS C - D	41	9	6	4	17	5
LOS E - F	17	7	2	3	1	4

SEA's new analyses of the current roadway conditions in each affected community resulted in many changes to queue lengths that were included in Section 3.3 of the Draft EIS. Those changes are described below.

Lake County, Illinois

Mundelein, Illinois

- IL 60/83 queue length changed from 950 feet to 930 feet, which continues to block Diamond Lake Road, a major cross street east of the crossing.

Kane, County, Illinois

Aurora, Illinois

- Liberty Street LOS changed from LOS E-F to D or better.

Will County, Illinois

Plainfield, Illinois

- Wolf's Crossing Road changed from LOS E-F to LOS D or better.
- 127th Street changed from LOS D or better to LOS E-F.
- Main Street changed from LOS E-F to LOS D or better.

- Peak period queue lengths.
    - 127th Street queue length changed from 250 feet to 545 feet, and would still block Lincoln Highway/US 30, a major cross street west of the crossing.

Frankfort, Illinois

- 88th Avenue/Pfeiffer Road queue length changed from 275 feet to 285 feet, and would still to block one major roadway, Sauk Trail. Lake County, Indiana

Dyer, Indiana

- Hart Street now has a queue length that blocks a major roadway. Queue lengths at Hart Street are approximately 680 feet at the crossing, which blocks Matteson Street, a major roadway, north of the crossing.

Griffith, Indiana

- Broad Street now has a queue length that blocks a major roadway. Queue lengths at Broad Street are approximately 1,035 feet at the crossing, which blocks one major roadway, Main Street, north of the crossing.

CN Subdivisions

The new analysis resulted in several changes in LOS for the CN subdivisions. Table 2.5-3, below is a summary of those changes for the 2007 roadway LOS analysis.

Table A3-2. 2007 LOS Summary of Roadways Crossing CN Subdivisions

LOS	Total	Waukesha (Illinois)	Freeport (Illinois)	Joliet (Illinois)	Chicago (Illinois)	Elsdon (Illinois/ Indiana)
LOS A - B	74	20	17	9	1	27
LOS C - D	49	17	13	2	0	17
LOS E - F	29	10	6	3	1	9

River Grove, Illinois

- 1st Avenue queue length changes from 925 feet to 1,100 feet, which continues blocks North Avenue/IL 64, which is a major cross street north of the crossing.

Des Plaines, Illinois

- Prospect Avenue queue length changes from 150 feet to 325 feet, which continues to block US 12, which is a major cross street west of the crossing.
- Golf Road/IL 58 queue length changes from 1,175 feet to 1,125 feet, which continues to block Rand Road/US 12, a major cross street east of the crossing.
- Rand Road/US 12 queue length changes from 950 feet to 925 feet, which continues to block Golf Road (IL 58), a major cross street south of the crossing.

North Riverside, Illinois

- Harlem Avenue LOS changes from LOS D to LOS E-F.

- Peak period queue lengths.
    - Harlem Avenue/IL 43 queue length changes from 1,325 feet to 1,500 feet, which continues to block 26th Street, a major cross street north of the crossing.
    - 1st Avenue/IL 171 queue length changes from 1,600 feet to 1,425 feet, which continues to block Cermak Road, a major cross street south of the crossing.

Bloomingdale, Illinois

- Gary Avenue queue length changes from 825 feet to 850 feet, which continues to block Army Trail Road, a major cross street north of the crossing.

Lemont, Illinois

- Lemont Street LOS changes from LOS E-F to D or better.
- Stephen Street LOS changes from LOS D to LOS E-F.
- Peak period queue lengths.
    - Lemont Street changes from 70 feet to 75 feet, which continues to block one major roadway, Main Street

Lockport, Illinois

- 9th Street/IL 7 queue length changes from 1,200 feet to 1,275 feet, which continues to block State Street/IL 171, a major cross street east of the crossing.

Joliet, Illinois

- Jackson Street queue length changes from 1,165 feet to 1,175 feet, which continues to block Scott Street/IL 53 and Ottawa Street, major cross streets west of the crossing.
- Ohio Street queue length changes from 290 feet to 825 feet, and this updated queue length blocks Scott Street/IL 53 and Chicago Street/IL 53, major cross streets to the west, along with two railroad crossings to the east.

Chicago Subdivision

Richton Park and University Park, Illinois

- The Draft EIS discussed two roadways in University Park, Illinois. These two roadways should have been separately analyzed as being in University Park and Richton Park. University Parkway/Stuenkel Road is in Richton Park, Illinois, and W. Dralle Road is in University Park, Illinois.

Elsdon Subdivision

City of Chicago, Illinois

- 51st Street is a four-lane collector, but was shown as a two-lane connector in the Draft EIS.

Harvey, Illinois

The Draft EIS stated that all roadways in Harvey, Illinois currently operate at LOS D or better with no queue length issues. SEA's updated analyses identified the following regional mobility changes in Harvey, Illinois.

- Ashland Avenue is a two-lane collector that runs north-south, crossing the Elsdon subdivision. Ashland Avenue LOS changed from D to E-F.
- Wood Street is a four-lane collector that runs north-south and operates at LOS D or better. Wood Street parallels Ashland Avenue within 0.25 mile, and is an alternate route to the congested Ashland Avenue.
- Peak period queue lengths:
    - Ashland Avenue's revised queue length is approximately 850 feet, which blocks 147th Street/Sibley Boulevard (IL 83), a major cross street to the north.

Phoenix, Illinois

The Draft EIS did not address potential mobility effects in Phoenix, Illinois. SEA reviewed the roadways in Phoenix and identified one that crosses CN's Elsdon Subdivision at-grade at 155th Street.

- 155th Street operates at LOS D or better.
- Community is urban-residential and industrial in the vicinity of the crossing.

SEA concluded that mobility in Phoenix would not be substantially affected and would remain acceptable levels because the at-grade crossing operates at LOS D or better.]

A.5 Village of Barrington Traffic Operations Analysis

CHAPTER 1 – INTRODUCTION

This report documents the study methodology and evaluation of existing and future traffic operations in the Village of Barrington, Illinois. As part of the proposed purchase of the Elgin, Joliet, and Eastern Railway Company (EJ&E), Canadian National Railway (CN) is proposing to increase the number of freight trains using the EJ&E line. Increases in train traffic proposed by CN will have an effect on automobile traffic operations in Barrington, especially at the EJ&E at-grade crossings. Three corridors have been identified to be analyzed to assess area mobility: Northwest Highway, Main Street/Lake Cook Road, and Hough Street. These three corridors serve a majority of traffic in the Barrington area and have at-grade crossings with the EJ&E line.

Public meeting commentors and local government officials have expressed concerns about the interaction of the new EJ&E rail traffic with existing UP freight rail traffic, METRA commuter rail traffic, Barrington High School traffic and existing roadway congestion. A closer review of these conditions was deemed necessary recognizing that vehicular mobility and safety in the Barrington area is a complex issue requiring additional study. Therefore, this more detailed analysis of the interaction of train movements and motorist travel was conducted.

Chapter 1 describes the study methodology. Chapter 2 describes the VISSIM model coding methodology. Chapters 3 and 4 identify existing traffic conditions and analysis results. Chapter 5 identifies 2015 future traffic conditions and provides a comparative analysis of two future scenarios.

1.1 STUDY PURPOSE

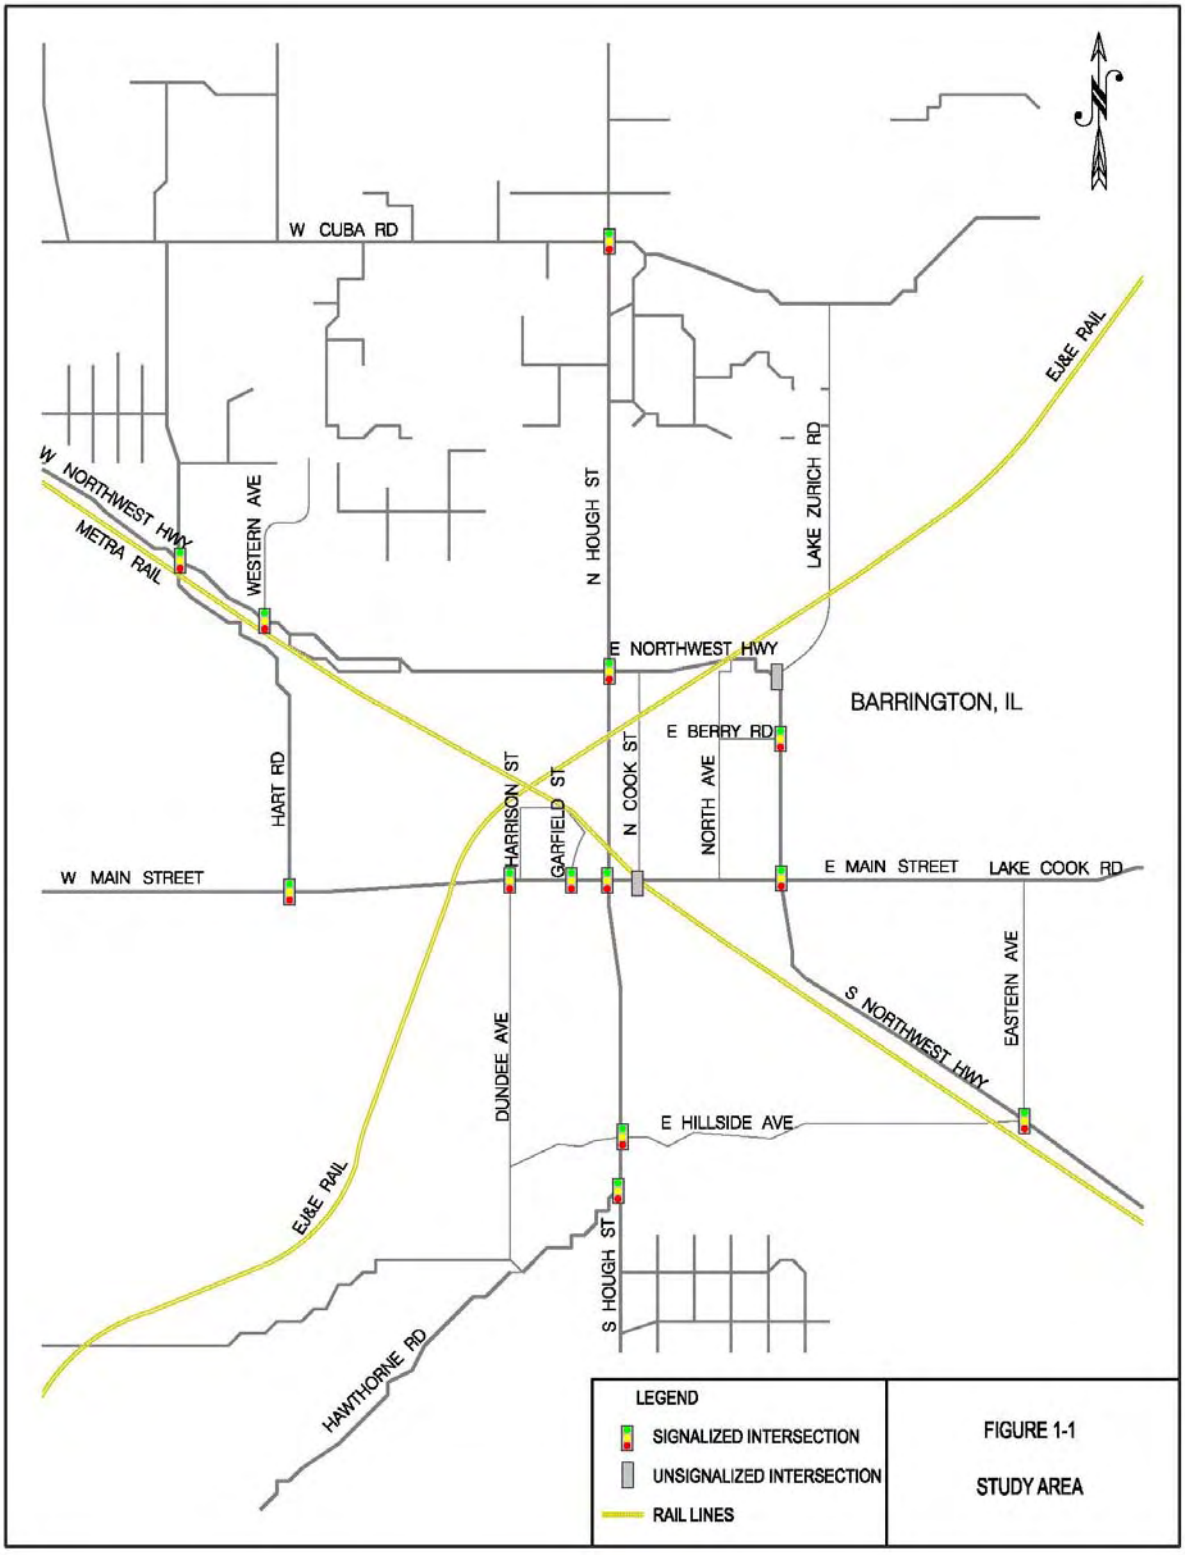
This study will address:

1) Commenter and local agency concerns regarding worsening of the Barrington community congestion and mobility resulting from the Proposed Action;
2) Concerns regarding the inter-related effects of the Proposed Action on Barrington's transportation network due to the close proximity of major roadway intersections and railway crossings;
3) Analysis of reasonable and feasible alternatives for mitigation of the serious transportation system effects of the queuing predicted for the Hough Street and EJ&E rail line at-grade crossing.

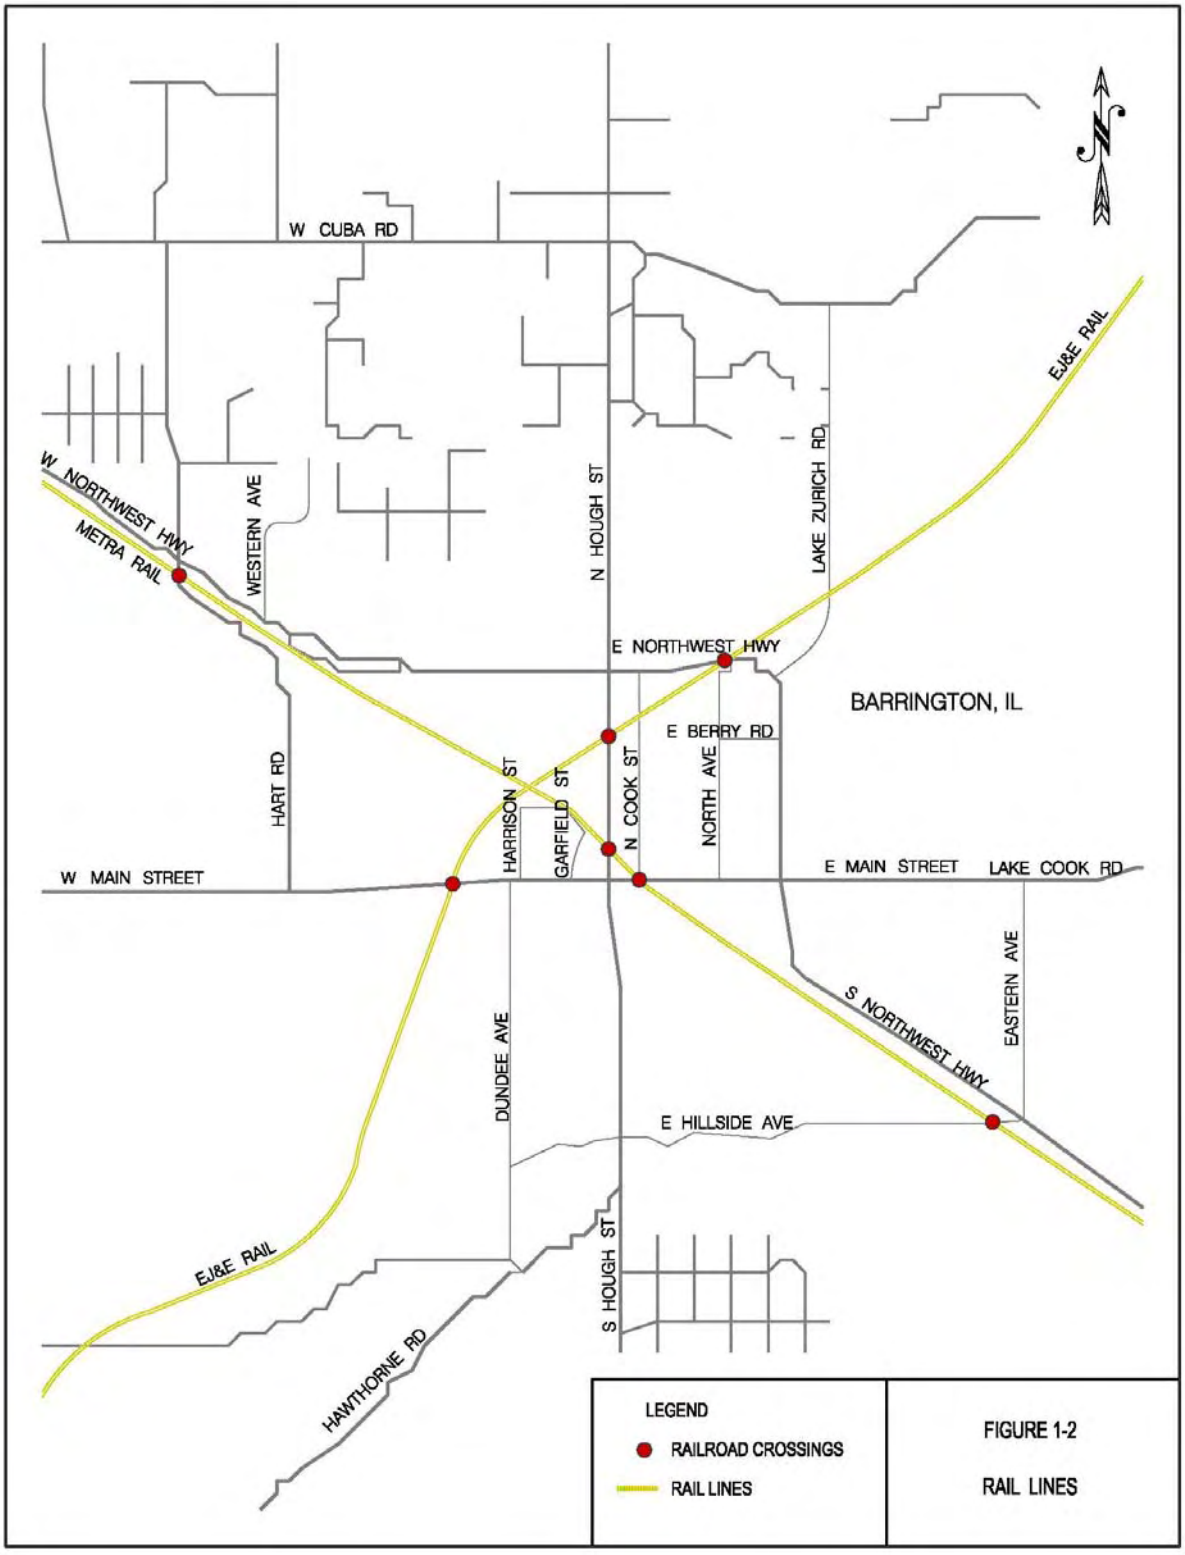
These objectives will be addressed using a high-level, microscopic simulation model to simulate existing and future traffic conditions on Northwest Highway, Main Street/Lake Cook Road, and Hough Street corridors. PTV's VISSIM software program was employed for this purpose. Two rail lines, the EJ&E and the Union Pacific/Northwest Line, cross these three study corridors. Vehicles in these corridors currently experience delays due to train movements at these crossings. The current proposal by CN would result in an increase in the number of freight trains traveling through Barrington on the EJ&E line by the year 2015.

Three simulation models have been developed to assess effects of the Proposed Action on automobile traffic in the study area:

- 2008 Existing Conditions (simulation calibration)
- 2015 Future Conditions - No Action (No Action for EJ&E)
- 2015 Future Conditions - Proposed Action (EJ&E traffic increases)



These models evaluate intersection operations under the above scenarios and provide several measures to document traffic operations in the corridors, as presented in this report.



1.2 STUDY AREA

The study area was designated to include regional roadways/highways and railroads that effect Barrington mobility. The three regional roadway corridors and two railroads listed earlier have been specifically included in the study area. The area consists of approximately 2.5 miles of Northwest Highway, between Hart Road and Eastern Avenue, 1.2 miles of Main Street/Lake Cook Road, between Hart Road and Northwest Highway, and 2.1 miles of Hough Street, between Cuba Road and Hawthorne Road, as shown in Figure 1-1. There are thirteen (13) signalized intersections and two (2) unsignalized intersections in the study area.

As mentioned in the previous section, two rail lines, the EJ&E and Union Pacific/Northwest Line, cross the study corridors as shown in Figure 1-2. These two rail lines cross these major corridors five (5) times in the study area.

According to CN, a total of five (5) trains currently run on the EJ&E railway line per day through the study area. For the purposes of this study, it was assumed that currently, no EJ&E trains travel through Barrington during the AM and PM peak hours. A total of ten (10) trains and seven (7) Metra commuter trains run on the Union Pacific/Northwest Line during the AM and PM peak periods, respectively, through the study area at this time.

CHAPTER 2 – VISSIM MODEL CODING METHODOLOGY

2.1 OVERVIEW

The three corridors in the study area were simulated using the microscopic simulation model VISSIM Version 5.00. VISSIM (a German acronym, which translated means "traffic in towns – simulation") has main two components: a traffic simulator and a signal state generator. The traffic simulator is a microscopic traffic flow simulation model which includes car following and a lane change logic model. The signal state generator is signal control software that uses detector information from the traffic simulator and updates the status of the traffic signals on a discrete time step basis (as small as one-tenth of a second). VISSIM is classified as a microscopic simulation model because it models vehicles and other components as individual units and updates them every second. After defining the street geometry, traffic control and vehicular volumes, VISSIM outputs many measures of effectiveness (MOEs) such as average delay, queue length, speed etc. that can then be used as a basis for comparison of alternatives. VISSIM also has the capability of modeling various modes of transit such as buses, trains, and rail. VISSIM has a user friendly 3D animation tool which can be used to show the existing and future transportation network in 3D animation form.

This chapter discusses the methodology for modifying VISSIM model parameters to account for roadway network changes in the study area.

2.2 ANALYSIS METHODOLOGY

The three corridors in the study area were simulated using VISSIM Version 5.00. It was used to evaluate AM and PM peak hour traffic operations on weekdays.

2.3 COMPUTER SIMULATION

One of the most important analytical tools of traffic engineering is microscopic simulation software. A transportation system simulation by means of a simulation model allows the prediction of the effects of modified lane configurations, traffic control and any changes made in the transportation system on the system's operational performance. Operational performance is measured in terms of MOEs, which include average vehicle speed, vehicle stops, delays, vehicle hours of travel, vehicle miles of travel, fuel consumption, and several other measures. The MOEs provide useful input in the selection of future alternative improvements to handle issues related to traffic such as traffic congestion, delay, queues, etc.

VISSIM is capable of simulating individual vehicle behavior in a roadway network and is capable of simulating the operation of signalized intersections. VISSIM applies interval-based simulation to describe traffic operations. Each vehicle is a distinct object whose characteristics are updated every second. Each variable control device (such as traffic signals) and each event are registered and updated every second. In addition, each vehicle is identified by category (auto, carpool, truck, or bus) and by type. Additionally, specific driver behavioral characteristics are assigned to specific vehicles. The major features of the VISSIM model are identified as follows:

- Link types and connectors
- Fleet components (bus, truck, car)
- Load factor (number of passengers/vehicle)
- Automobile routing and turning movement
- Bus operations (headways, dwell times, stations, and routes)
- Priority rules (right of way designations)
- Stop and yield signs

- Pretimed/actuated signal control

2.4 Model Parameters

The traffic flow model used by VISSIM is a discreet, stochastic, time step based microscopic model, with driver-vehicle-units as single entities. The model contains a psycho-physical car following model for longitudinal vehicle movement and a rule-based algorithm for lateral movements (lane changing). The model is based on the continuous work of Wiedemann.

Vehicles follow each other in an oscillating process. As a faster vehicle approaches a slower vehicle on a single lane, it has to decelerate. The action point of conscious reaction depends on the speed difference, distance, and driver-dependant behavior. On multi-lane links, moved up vehicles check whether they can improve their position by changing lanes. If so, they check the possibility of finding acceptable gaps on neighboring lanes. Car following and lane-changing together form the traffic flow model, comprising the basis of VISSIM.

More detailed information regarding VISSIM modeling parameters can be found in the VISSIM user's manual.

2.5 Model Development

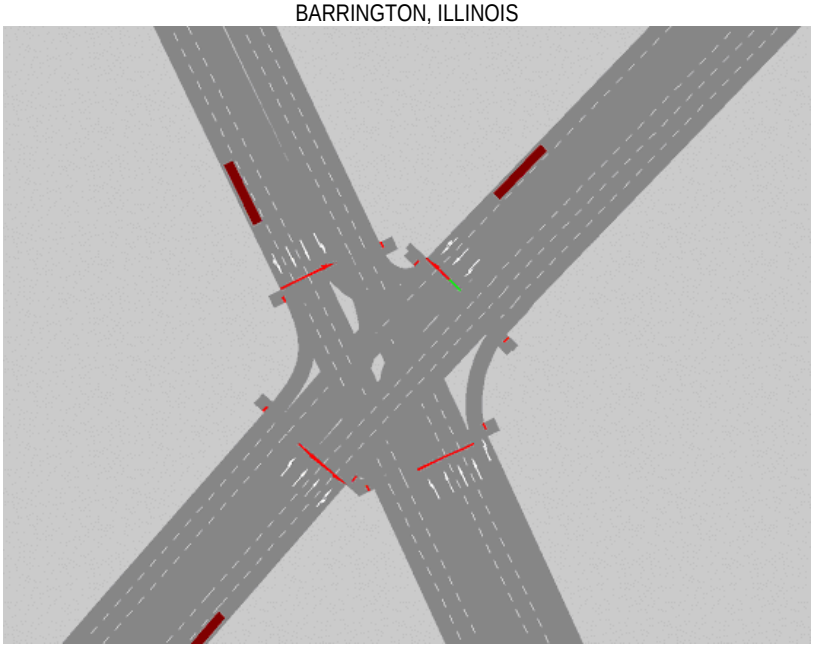
The HDR|WHM team developed the network for the study area. Field observations and aerial photographs were used to obtain accurate geometrics. Year 2008 traffic volume counts collected in September 2008 were used to develop the existing condition model.

The major component inputs for the study area VISSIM model included the following:

Roadway Geometrics – The first step in defining a network is describing the network geometry. VISSIM uses the concept of links and connectors to define the roadway network. Links are one-directional segments of streets or freeways, and connectors are usually the intersection of two or more links. In the case of a two-way street, each roadway block would consist of two one-directional links as shown in Figure 2-1.

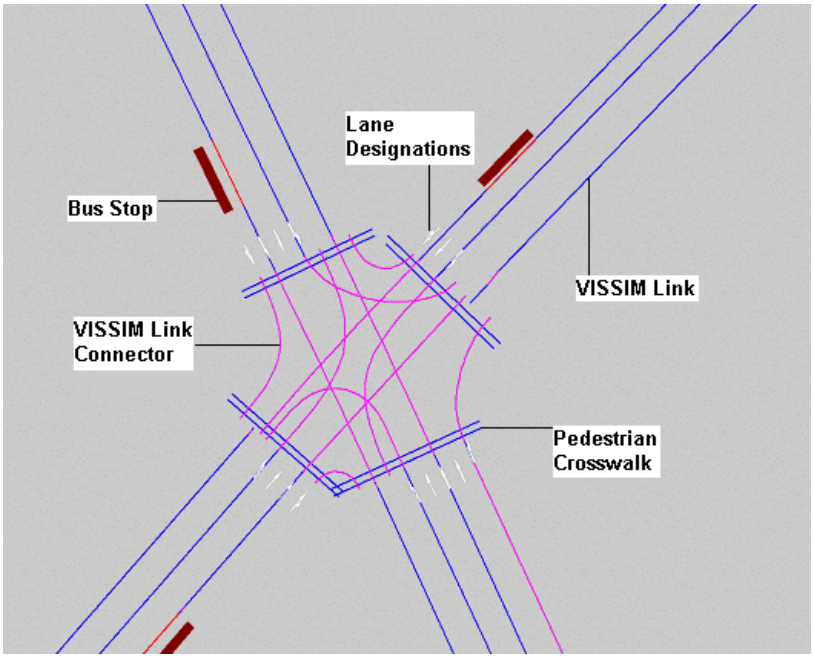
Volume Data – Year 2008 traffic volume counts collected in the field were used for developing the existing condition model update.

Entry and exit volumes at the periphery of the network were obtained from tube counts and intersection turning movement counts (TMCs), since entry volumes are coded as input when building the model, and exit volumes are used to calibrate the model to ensure appropriate distribution of traffic through the simulated network.



When coding the model, turning movement input describes how traffic is distributed to departure links. TMCs were used to determine existing routing decisions for each approach at an intersection. When a simulation is run, traffic volumes enter the network through entry links and are distributed through the network according to routing decisions assigned to each intersection approach.

Traffic Control – Existing conditions analysis involved coding of traffic signal phasing, timing, and coordination in Synchro, a microcomputer traffic signal coordination software program developed by Trafficware. This traffic signal information was then imported into the VISSIM model to simulate the operation of existing signalized intersections.



Rail Operations – Information on rail line and at-grade crossings for the EJ&E and Metra rail lines were obtained from Canadian National Railway Company and Regional Transportation Authority, respectively, and

were included in the development of the VISSIM network. Two (2) rail lines that traverse the study area were coded in the model.

FIGURE 2-1
INTERSECTION LINK TO CONNECTOR DIAGRAM
VILLAGE OF BARRINGTON TRAFFIC OPERATIONAL ANALYSIS
BARRINGTON, ILLINOIS

(A) Typical VISSIM Intersection

(B) Typical Intersection Converted to VISSIM Link-Connector Diagram

2.6 Model Calibration

The models were calibrated using field-counted traffic volume data. Turning movement counts at intersections in the study area were used to verify that volumes shown on the corresponding links in the model were distributing in a manner consistent with real-world conditions. In addition, field observations were conducted and the models were calibrated based on field observations of queue lengths, traffic operations, and rail operations.

In order to account for inherent variability in traffic flow and operations, ten (10) replicate runs were performed for each model scenario, and the average results were reported.

2.7 MEASURES OF EFFECTIVENESS

Operational performance is expressed in terms of measures of effectiveness (MOEs), which include average vehicle speed, delay, vehicle miles of travel, travel time, fuel consumption, emissions and several other measures. While the VISSIM model provides a wide variety of MOEs, only a few MOEs that focus on the scope of this project were used to establish a baseline evaluation of existing traffic operations.

Network Delay – Delay is a measure of lost travel time and is influenced by a number of factors including cycle length, signal coordination and degree of saturation or volume-capacity ratio. The *Highway Capacity Manual (HCM)* defines total delay as the total time elapsed from when a vehicle stops at the end of a queue until the vehicle departs from the stop line. It is measured in vehicle-hours and was measured for autos and buses.

Network Vehicles – Network Vehicles are measured in vehicles per hour and identifies the vehicles that have left the network or reached their destination. It was measured for autos and buses.

Network Travel Time – Travel time is measured in hours. Travel time identifies the total amount of time, including moving time, delay time, and stop time, that it takes for all vehicles to travel through the study area network. Travel time was calculated for vehicles and buses.

Average Speed – Average speed is measured in miles per hour and identifies the average speed of a vehicle in the network. It is calculated by taking the average of all link speeds. Average speed is a useful measure of effectiveness to assess the impact of network changes for alternative models and was measured for autos and buses.

Intersection Level of Service – Level of service (LOS) is a qualitative measure of operating conditions at a location and is directly related to vehicle delay at intersections, as shown in Table 2-1. LOS is given a letter designation ranging from A to F (free flow to heavily congested). For example, LOS can be related to the grading scale of a report card: A = excellent, B = good, C = average, D = below average, E = needs improvement, and F = failing. Utilizing procedures in the *HCM* and the MOEs reported by VISSIM, LOS was determined for intersections within the study area network.

Maximum Queue Length – Maximum queue length is the distance from the stop bar at a given intersection approach to the end of the furthest upstream vehicle in the queue at that approach.

TABLE 2-1
LEVEL-OF-SERVICE DEFINITIONS FOR INTERSECTIONS
VILLAGE OF BARRINGTON TRAFFIC OPERATIONAL ANALYSIS
BARRINGTON, ILLINOIS

Level of Service	Control Delay (sec/veh)		Description
	Signalized Intersections	Unsignalized Intersections	
A	≤ 10.0	≤ 10.0	Very low vehicle delays, free traffic flow, signal progression extremely favorable, most vehicles arrive during given signal phase.
B	10.1 to 20.0	10.1 to 15.0	Good signal progression, more vehicles stop and experience higher delays than for LOS A.
C	20.1 to 35.0	15.1 to 25.0	Stable traffic flow, fair signal progression, significant number of vehicles stop at signals.
D	35.1 to 55.0	25.1 to 35.0	Noticeable traffic congestion, longer delays and unfavorable signal progression, many vehicles stop at signals.
E	55.1 to 80.0	35.1 to 50.0	Limit of acceptable vehicle delay, unstable traffic flow, poor signal progression, traffic near roadway capacity, frequent cycle failures.
F	> 80.0	> 50.0	Unacceptable delay, extremely unstable flow, heavy congestion, traffic exceeds roadway capacity, stop-and-go conditions.

Source: *Highway Capacity Manual*, Transportation Research Board, 2000.

CHAPTER 3 – EXISTING CONDITIONS

The analysis of existing conditions forms the basis for VISSIM traffic simulation development and for evaluation of future scenarios. The major elements of the existing conditions scenario are year 2008 vehicular volumes collected as part of the study, existing signal timing data, as well as geometrics of the existing roadway network. Field studies were conducted to collect supplemental data, such as queue lengths, needed for the evaluation of traffic operations. Traffic data collected in the field included AM and PM peak period intersection TMCs. Illinois Department of Transportation (IDOT) provided signal timing information for signalized intersections. Further, freight and commuter train timetables were obtained from EJ&E, CN, and Regional Transportation Authority of Northeast Illinois (RTA). This chapter describes how this information was used to develop the VISSIM model for the subsequent analyses.

3.1 COMPUTER SIMULATION

The three corridors in the study area were simulated using VISSIM Version 5.00. VISSIM is classified as a microscopic simulation model because it models vehicles and other modes as individual units, updating their properties (such as location) every second. After defining the street geometry, traffic control and vehicular volumes, VISSIM outputs several MOEs that can be used as a basis for comparison. A more detailed description of the model parameters, model development and model calibration can be found in Chapter 2.

3.2 INTERSECTION SIGNAL TIMING

There are currently thirteen (13) signalized intersections in the study area. All the intersections are maintained and operated by IDOT. The HDR|WHM team coordinated with IDOT to obtain existing intersection signal timing data. The existing signal timing data were coded into VISSIM to ensure the model results reflect actual operations in the field.

3.3 EXISTING TRAFFIC DATA

Extensive data collection was performed to obtain information on existing conditions along the Northwest Highway, Main Street/Lake Cook Road, and Hough Street corridors.

AM peak hour (7:00 to 9:00 AM) and PM peak hour (4:00 to 6:00 PM) turning movements were collected in September 2008 as part of this study. AM and PM peak hour TMCs were collected at the signalized and unsignalized intersections along the corridors in the study area. The peak hour TMCs are summarized in the following section. A summary of the peak hour traffic volumes along the corridors are identified in Table 3-1. Twenty-four-hour TMCs were collected at twelve (12) locations in the study area and were focused on the outskirts of the limits of the study area to capture the number of vehicles entering and exiting the study area. Table 3-2 shows the hourly distribution of traffic volumes along the three major study area corridors.

AM and PM peak hour travel time runs were also performed along Northwest Highway, Hough Street, and Main Street/Lake Cook Road. The travel time runs assisted in gauging the average traveling speeds and levels of congestion on each roadway and also to calibrate the existing models.

In addition to the traffic data collected, field observations were performed to identify queue lengths at study intersections.

3.5 EXISTING RAIL SYSTEM

As mentioned in previous sections, two rail lines, the EJ&E and Metra, cross the study corridors.

EJ&E is a Class II railroad which provides rail service to approximately 100 customers, including steel mills, coal utilities, plastics and chemical producers, steel processors, distribution centers, and scrap processors. In addition to operating local trains in the Chicago and Northwest Indiana region, EJ&E connects customers to Class I rail lines. A total of five (5) trains run on the EJ&E railway line per day through the study area. For the purposes of this study, it was assumed that no EJ&E trains travel through Barrington during the AM and PM peak hours.

The EJ&E at-grade crossings in the study area are as follows:

- Northwest Highway, east of Hough Street
- Lake Zurich Road, east of Hough Street
- Hough Street, south of Northwest Highway
- Lake Cook Road/Main Street, west of Hough Street

Metra, the commuter rail division of RTA, provides commuter service on its own rail lines and also has trackage rights on freight railroads. Metra operates 720 trains per day and provided service to eighty-two (82) million passengers in 2007. Metra's rail lines are intertwined with Class I freight rail lines through a series of parallel tracks, trackage rights granted to Metra on freight rail lines, and dozens of rail/rail at-grade crossings. A total of ten (10) trains and seven (7) trains run on the Metra railway line during the AM and PM peak periods, respectively, through the study area.

The Metra at-grade crossings in the study area are as follows:

- Lake Cook Road/Main Street, east of Hough Street
- Hough Street, north of Lake Cook Road/Main Street
- Hart Road, South of Northwest Highway
- Eastern Avenue, southwest of Northwest Highway

CHAPTER 4 – ANALYSIS OF EXISTING CONDITIONS

The Existing Conditions model (Year 2008) reflected the current conditions and operational problems associated with the three corridors. This chapter describes the results of analyses for existing conditions.

4.1 MEASURES OF EFFECTIVENESS

Operational performance is expressed in terms of measures of effectiveness (MOEs), which include average vehicle speed, delay, vehicle miles of travel, travel time, fuel consumption, emissions and several other measures. While the VISSIM model provides a wide variety of MOEs, only a few MOEs that focus on the scope of this project were used to establish existing traffic operations.

The MOEs that were evaluated for the existing conditions analysis include travel time, network delay, network vehicles, average speed and intersection level of service. Detailed descriptions of these MOEs can be found in Chapter 2.

4.2 NETWORK TRAFFIC OPERATIONS

Area-wide statistics are critical to the evaluation of the overall efficiency of the transportation network. Results for network travel time, network delay, network vehicles, and average speed for autos is summarized in Table 4-1 and shown graphically in Figures 4-1 and 4-2. Existing intersection level of service results for the AM and PM peaks are summarized in Table 4-2 and Figures 4-3 and 4-4.

Existing intersection LOS is an important MOE for evaluating the existing conditions along the study corridor. Table 4-2 shows the existing levels of service for the intersections in the network during the AM and PM peak periods. The intersection LOSs are shown graphically in Figure 4-3 and Figure 4-4.

CHAPTER 5 – 2015 TRAFFIC FORECASTS

The year 2015 was designated as the horizon year for full implementation of the Proposed Action. This study evaluates regional travel and intersection operations for the following two (2) future scenarios:

- 2015 Future Conditions - No Action (no change in the number of EJ&E trains)
- 2015 Future Conditions - Proposed Action (increase in the number of EJ&E trains)

5.1 2015 NO ACTION SCENARIO

The No Action scenario assumed no modifications to the train patterns on the EJ&E rail line. Future traffic conditions under this scenario assumed an increase in automobile traffic and Metra commuter rail traffic, with no increase in freight rail traffic on the EJ&E rail line.

Travel demand forecasts for 2015 are not available from local planning agencies normally responsible for developing those values. Therefore, available traffic counts were factored to simulate a 2015 travel forecast. Initially, the new traffic counts taken in September of 2008 were factored at 3% per year in the manner similar to the factoring performed for the Draft EIS analysis. However, with all movement counts factored in this manner, traffic demands became so great that the simulation was not able to process the traffic meaningfully. With traffic factored in this manner the area becomes grid-locked.

Therefore, traffic volumes along the corridors in the study area were factored to reflect 2015 traffic conditions by applying an annual growth rate of two (2) percent and three (3) percent in the AM and PM peak periods, respectively, to the existing 2008 traffic volumes. The growth rates still reflect increased estimates by Lake County engineering officials and iterative estimates of future congestion levels. These rates of increase were applied only to the through traffic volumes on the Northwest Highway and Hough Street. No growth rate was applied to the traffic volumes on Main Street/Lake Cook Road or to turning movements to/from local streets in the Village of Barrington. Assumptions of no growth in certain vehicle movement on these roadways was justified for this analyses since these areas are well built out and may not experience future increases. In addition, traffic congestion already exists in the Barrington region encouraging regional travelers to take routes that do not use these congested roadways.

Future year increases in Metra train operations were also input to the simulation. The number of trains on the Metra rail line was assumed to increase by one (1) train in both the AM and PM peak periods resulting in a total of eleven (11) trains and eight (8) trains during the AM and PM peak periods, respectively, through the study area.

Signal timing is an important input to the traffic simulation and future year timing schemes will be important to efficient regional travel. Signal timing optimization is an effective way to adjust to increasing traffic volumes and ever changing traffic patterns. It was assumed that IDOT would monitor signals in the study area and make modifications to signal timing when necessary. Minor modifications to the signal timing were assumed for some of the intersections in the study area. Additionally, a traffic signal was assumed at the intersection of Northwest Highway and Lake Zurich Road because it operated at an unacceptable LOS under the 2008 existing traffic conditions. It was anticipated that this intersection would meet traffic signal warrants by 2015, and hence, a signal was assumed at this intersection under this scenario.

5.2 2015 PROPOSED ACTION SCENARIO

The Proposed Action scenario assumed modifications to the train patterns on the EJ&E rail line. As per the proposal by Canadian National Railway, the number of trains on the EJ&E rail line will increase from five (5) to twenty (20) trains per day through the study area. For analysis purposes, it was assumed that one (1) train of average length would travel on the EJ&E rail line during both the AM and PM peak hours through the study area under this scenario. This is assumption is conservative because CN has agreed to adhere to the existing freight train curfews, which could limit the number of trains on the EJ&E rail line during the AM and PM peak periods. The actual number and

length of trains traveling the EJ&E during morning or evening peak periods, however, were not confirmed by CN. The same growth trends and signal timings were used as in the No Action scenario.

A summary of the estimated 2015 peak hour traffic volumes along the corridors is provided in Table 5-1.

5.3 COMPARISON OF NETWORK TRAFFIC OPERATIONS

Area-wide statistics are critical to the evaluation of the overall efficiency of the transportation network. A comparison of the network travel time, network delay, network vehicles, and average speed for autos between 2015 No Action and 2015 Proposed Action traffic conditions is summarized in Table 5-2 and shown graphically in Figure 5-1 and Figure 5-2. The addition of an EJ&E freight train traveling through the study network was the only programmed difference between the No Action and Proposed Action scenarios. Because VISSIM is a stochastic simulation model, however, network traffic volumes differed slightly—but not substantially—between the two scenarios.

As shown in Table 5-2, based on the existing traffic model MOEs, the PM peak period was the critical peak period in that it had the highest traffic volumes, which resulted in the greatest travel time and delay within the network with vehicles traveling at low speeds.

TABLE 5-2
2015 NO ACTION AND 2015 PROPOSED ACTION NETWORK-WIDE AVERAGE STATISTICS

As mentioned in previous sections, LOS is an important MOE for evaluating the existing conditions along the study corridor. Table 5-3 and Figures 5-3 through 5-6 show the LOS at the intersections in the study area for the 2015 AM and PM No Action scenarios. Of the fifteen intersections in the study network, eleven (11) intersections operated at an acceptable LOS during both the AM and PM peak periods, while four (4) intersections operated at an unacceptable LOS during both the AM and PM peak periods.

5.4 COMPARISON OF AT-GRADE CROSSING MEASURES OF EFFECTIVENESS

In addition to the intersection analyses, MOEs were obtained at the EJ&E at-grade crossings in the study area at Northwest Highway, Hough Street, and Main Street/Lake Cook Road. These included the maximum queue lengths and average vehicle delay at these locations. All crossing MOEs were obtained at sixty-second increments to isolate the effects of the increased EJ&E train traffic.

The methodologies used to calculated vehicle delay and queue lengths used in this study and the Draft EIS and the Final EIS are different. This study uses hourly vehicle counts, observed queue lengths and travel times taken on roadways in the Barrington area. The simulation model has been calibrated with this information to replicate actual traffic conditions on Barrington area roadways. Delay and queue length calculations used in the Draft and Finals EIS documents relied on 24 hour traffic count data at the railroad grade crossings. The methodology used an approach that used available data and traffic operations assumptions. Results of these different methods will be different due to these variations in data and calculation techniques.

Northwest Highway Crossing

No Action Conditions.

During the AM peak period under the No Action scenario, the Northwest Highway rail/highway at-grade crossing experienced a 550-foot queue resulting from spillback due to insufficient capacity at the intersection with Main Street/Lake Cook Road. In the westbound direction, however, no vehicle queuing was observed. During the PM peak period, the eastbound direction exhibited no vehicle queuing while the maximum vehicle queue in the westbound direction extended south from the intersection with Hough Street to just south of Berry Road due to insufficient capacity at the intersection of Northwest Highway and Hough Street. This results in a 1,600-foot maximum vehicle queue at the existing Northwest Highway crossing under the No Action scenario. Table 5-4 summarizes the travel times along Northwest Highway in each direction of travel between Hart Road and Eastern Avenue under the No Action and Action scenarios.

Proposed Action Conditions

During the AM and PM peak periods, the addition of a freight train on the EJ&E line resulted in minimal increases in travel time along Northwest Highway over the peak period as shown on Table 5-4. Travel time increased during and immediately following the freight train but soon returned to No Action conditions.

Table 5-5 provides a comparison of the maximum queue lengths at the Northwest Highway at-grade crossing under the No Action and Proposed Action scenarios. Figure 5-9 and Figure 5-10 show the effects of the EJ&E train on maximum queue lengths and average delay at the Northwest Highway at-grade crossing during the AM peak period. Queues caused by the blocked crossing dissipated after approximately fourteen (14) minutes and five (5) minutes in the eastbound and westbound directions of travel, respectively.

Under the Proposed Action scenario, the maximum eastbound vehicle queue length at the railway/highway at-grade crossing increased zero to 700-feet or an increase of 700 feet over the No Action scenario. Figure 5-11 and Figure 5-12 show the effects of the EJ&E train at Northwest Highway during the PM peak period. In the eastbound direction, queues caused by the blocked crossing dissipated after approximately six (6) minutes; however, queuing in the westbound direction remained for over twenty (20) minutes due to the high volumes traveling in this direction during the PM peak period and existing capacity constraints at the intersection of Northwest Highway and Hough Street. Under the Proposed Action scenario, the average westbound vehicle queue length increased by from 1,600 feet to 3,700 feet for an increase of 2,100 over the No Action scenario.

Table 5-4 shows that travel times along the Northwest Highway Corridor would increase over the peak hour study period.

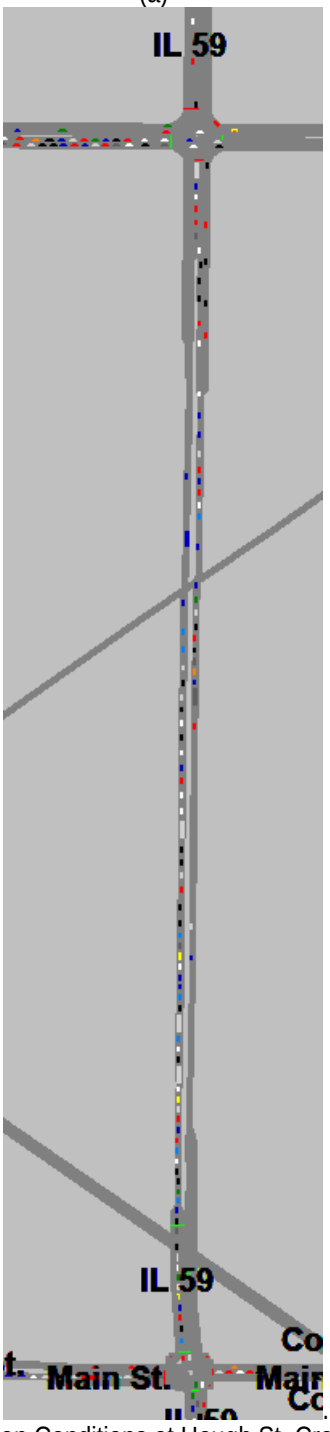
Hough Street Crossing

No Action Conditions.

During the AM peak period under the No Action scenario, the Hough Street at-grade crossing experienced occasional vehicle queuing in the northbound direction while vehicle queues in the southbound direction extended north past Northwest Highway because of queue spillback due to insufficient capacity at the intersection of Hough Street and Main Street, resulting in a maximum vehicle queue of 1,150 feet at the Hough Street crossing under No Action conditions. Figure 5-13 (a) shows a screen capture of vehicle queuing under the No Action scenario. During the PM peak period, the northbound direction exhibited occasional vehicle queuing due to congestion at the intersection of Hough Street and Northwest Highway while no vehicle queuing existed in the southbound direction. Table 5-6 summarizes the travel times along Hough Street in each direction of travel between Cuba Road and Hawthorne Road under the No Action and Proposed Action scenarios.

Proposed Action Conditions



During the AM and PM peak periods, the addition of a freight train on the EJ&E line resulted in minimal increases in travel time along Hough Street over the peak period. Travel time increased during and immediately following the freight train but soon returned to No Action conditions.

Table 5-7 provides a comparison of the maximum queue lengths at the Hough Street at-grade crossing under the No Action and Proposed Action scenarios. Figure 5-14 and Figure 5-15 show the effects of the EJ&E train on maximum queue lengths and average delay at the Hough Street at-grade crossing during the AM peak period. Queues caused by the blocked crossing dissipated after approximately five (5) minutes and eight (8) minutes in the northbound and southbound directions of travel, respectively. Figure 5-13 (b) shows a screen capture of vehicle queuing under the Proposed Action scenario. Figure 5-16 and Figure 5-17 show the effects of the EJ&E train on the same MOEs at Hough Street during the PM peak period. In the southbound direction, queues caused by the blocked crossing dissipated to acceptable levels after approximately five (5) minutes. In the northbound direction, the queues remained for more than twenty (20) minutes due to high volumes in the northbound direction during the PM peak period and existing capacity constraints along Hough Street. Under the Proposed Action scenario, the maximum northbound vehicle queue length increases from 450-feet to 2,000-feet an increase of approximately 1,500 feet over the No Action scenario.

Table 5-6 shows that travel times along the Hough Corridor did not change substantially over the peak hour study period.

Main Street/Lake Cook Road Crossing

No Action Conditions.

During the AM peak period under the No Action scenario, the Main Street/Lake Cook Road at-grade crossing experienced 2900 feet of vehicle queuing in the eastbound direction because of spillback due to insufficient capacity at the intersection with Hough Street. No vehicle queuing was exhibited in the westbound direction. During the PM peak period, neither direction of travel experienced vehicle queuing. Table 5-8 summarizes the travel times along Main Street/Lake Cook Road in each direction of travel between Hart Road and Northwest Highway under the No Action and Action scenarios.

Proposed Action Conditions

During the AM and PM peak periods, the addition of a freight train on the EJ&E line resulted in minimal increases in travel time along Main Street/Lake Cook Road over the peak period. Travel time increased during and immediately following the freight train but soon returned to No Action conditions.

Table 5-9 provides a comparison of the maximum queue lengths at the Main Street/Lake Cook Road at-grade crossing under the No Action and Proposed Action scenarios. Figure 5-18 and Figure 5-19 show the effects of the EJ&E train on maximum queue lengths and average delay at the Main Street/Lake Cook Road at-grade crossing during the AM peak period. In the eastbound direction of travel, vehicle queuing was similar under both scenarios while vehicle queues dissipated after approximately four (4) minutes in the westbound direction. Figure 5-20 and Figure 5-21 show the effects of the EJ&E train on the same MOEs at Main Street/Lake Cook Road during the PM peak period. In both directions of travel, vehicle queues dissipated after approximately six (6) minutes.

Table 5-8 shows that travel times along the Main Street/Lake Cook Road would increase over the peak hour study period.

MAIN STREET/LAKE COOK ROAD WESTBOUND PERFORMANCE – PM PEAK
VILLAGE OF BARRINGTON TRAFFIC OPERATIONAL ANALYSIS
BARRINGTON, ILLINOIS

5.5 Summary of 2015 No Action and Proposed Action Results

The following is a summary of the changes in measures of effectiveness for the 2015 No Action and Proposed Action scenarios for the network as a whole and at the intersection level:

- For the study area, the total travel time increased by 1.5 percent and 1.4 percent during the AM and PM peak periods, respectively, under the Proposed Action scenario when compared to the No Action scenario.
- For the study corridors, Northwest Highway, Hough Street and Main Street/Lake Cook Road, travel times did not change during the peak hour study periods between the No Action and Proposed Action conditions.
- For the study area, the total delay time increased by 2.7 percent and 3.3 percent during the AM and PM peak periods, respectively, under the Proposed Action scenario when compared to the No Action scenario.
- In the No Action scenario, four intersections operated at an unacceptable LOS (E and F) during both the AM and PM peak periods. There was no increase in the number of intersections operating at an unacceptable LOS under the Proposed Action scenario.
- The Proposed Action plan does not seriously affect any of the Measures of Effectiveness.

The following is a summary of the changes in MOEs under the 2015 No Action and Proposed Action scenarios at the EJ&E railroad crossing locations:

Northwest Highway Crossing:

- Under the No Action scenario, vehicle queuing was present at the crossing in the eastbound direction during the AM peak period and in the westbound direction during the PM peak period due to insufficient capacity at the intersections with Main Street/Lake Cook Road and Hough Street, respectively.
- There was a minimal increase in travel time along Northwest Highway between Hart Road and Eastern Avenue under the Proposed Action scenario compared to the No Action scenario.
- During the AM peak period under the Proposed Action scenario, the eastbound and westbound maximum queue lengths increased by 1,750 feet and 500 feet, respectively, over the No Action scenario. These queues dissipated after approximately three (3) minutes in both directions of travel. Although the maximum queue length increased by 1,750 feet for eastbound traffic in the AM peak, the average vehicle queue length only increased by 450 feet for the time period compared to the No Action scenario.
- During the PM peak period under the Proposed Action scenario, the eastbound and westbound maximum queue lengths increased by 700 feet and 2,100 feet, respectively, over the No Action scenario. These queues dissipated after approximately six (6) minutes in the eastbound direction but remained for over twenty minutes in the westbound direction due to high traffic volumes and a lack of capacity at the intersection of Northwest Highway and Hough Street. Although the maximum queue length increased by 2,100 feet for westbound traffic in the PM peak, the average vehicle queue length only increased by 800 feet for the time period compared to the No Action scenario.

Hough Street Crossing:

- Under the No Action scenario, vehicle queuing was present at the crossing in the southbound direction during the AM peak period and in the northbound direction during the PM peak period from queue spillback due to insufficient capacity at the intersections with Main Street/Lake Cook Road and Northwest Highway, respectively.
- During the AM peak period under the Proposed Action scenario, the northbound maximum queue length increased by 900 feet over the No Action scenario. This queue dissipated after five (5) minutes. There was no significant increase in the southbound maximum queue length over the No Action scenario.

- During the PM peak period under the Proposed Action scenario, the northbound and southbound maximum queue lengths increased by 1,400 feet and 900 feet, respectively, over the No Action scenario. These queues remained for over twenty minutes in the northbound direction but mostly dissipated after five (5) minutes in the southbound direction. Although the maximum queue length increased by 1,400 feet for northbound traffic in the PM peak, the average vehicle queue length only increased by 600 feet for the time period compared to the No Action scenario.
- There was a minimal increase in travel time along Hough Street between Cuba Road and Hawthorne Road under the Proposed Action scenario compared to the No Action scenario.

Main Street/Lake Cook Road:

- Under the No Action scenario, vehicle queuing was present at the crossing in the eastbound direction during the AM peak period from queue spillback due to insufficient capacity at the intersection with Hough Street.
- During the AM peak period under the Proposed Action scenario, the westbound maximum queue length increased by 100 feet over the No Action scenario. This queue dissipated after three (3) minutes. The eastbound maximum queue length remained unchanged over the No Action scenario.
- During the PM peak period under the Proposed Action scenario, the eastbound and westbound maximum queue lengths increased by 1,000 feet and 1,100 feet, respectively, over the No Action scenario. These queues dissipated after six (6) minutes.
- There was a minimal increase in travel time along Main Street/Lake Cook Road between Hart Road and Northwest Highway under the Proposed Action scenario compared to the No Action scenario.

5.6 Conclusion

This study was prepared to address the following issues:

1). Commenter and local agency concerns regarding worsening of the Barrington community congestion and mobility resulting from the Proposed Action;
2). Concerns regarding the inter-related effects of the Proposed Action on Barrington's transportation network due to the close proximity of major roadway intersections and railway crossings;
3.). Analysis of reasonable and feasible alternatives for mitigation of the serious transportation system effects of the queuing predicted for the Hough Street and EJ&E line at-grade crossing.

Impacts to or from these issues is summarized below.

<u>Worsening Barrington Congestion</u>

Results of the Village of Barrington Traffic Operational Analysis show that the increase in train traffic on the EJ&E line will likely have some impacts on traffic congestion in Barrington but will not considerably worsen traffic congestion or mobility. The analysis shows that congestion will worsen and mobility will decline with predictions of continued traffic growth. Under the Proposed Action scenario, network-wide total delay time increased by four (4) percent and five (5) percent during the AM and PM peak periods, respectively, over the No Action scenario. Individual intersection levels of service, however, did not degrade under the Proposed Action scenario.

In the VISSIM analysis, a freight train passing through Barrington on the EJ&E line during the AM and PM peak periods caused increases in maximum vehicular queue lengths at most of the study at-grade crossing approaches. In many of these cases, however, the queuing did not last for more than six minutes. Queuing was significant at the Hough Street crossing for the northbound direction during the PM peak. The maximum queue length increased by approximately 1,400 feet at this location and the queue length does not diminish to No Action level for over 20 minutes due to high traffic volumes during the peak travel periods. Hough Street at this crossing is primarily a 2-lane

roadway in this section and the lack of available capacity causes this high level of queuing and inability for the queuing to dissipate quickly. Queuing due to the EJ&E line was most significant at the Northwest Highway crossing in the PM peak for the westbound direction. Due to the high traffic volumes traveling in the westbound direction in the PM peak, the maximum queue increases by over 2,100 feet and does not diminish to No Action levels for over 20 minutes. Northwest Highway is a four-lane undivided roadway near the crossing, carrying high traffic volumes throughout the day, and existing capacity is constrained by the signalized intersections upstream and downstream of the crossing. Even with the available capacity of two-lanes in each direction, the maximum queue is still increased by 2,100 feet over both lanes. This results in a greater delay experienced by all vehicles at this crossing location.

Inter-relation of Thoroughfares and Railways

Public meeting commentors and local officials expressed concerns that the combination of a closely spaced major thoroughfare network and two rail line crossings in the area could result in traffic grid lock during EJ&E train crossing events. This simulation determined that this would not occur. The simulation does show that the extent of existing and proposed traffic congestion does create potential for long traffic queues in the region.

Reasonable and Feasible Alternatives for Mitigation

Results of this analysis show that the major source of congestion in Barrington is the excess vehicle demand at existing major thoroughfare intersections. Existing congestion at these intersections backs traffic up into significant queues. Construction of a grade separation at Hough Street and the EJ&E will not prevent traffic queues on Hough Street, Northwest Highway or Main Street/Lake Cook Street. Therefore, construction of a grade separation alone at either the Hough Street or Northwest Highway crossings is not a feasible way to address regional congestion due to capacity constraints at existing signalized intersections. Construction of a grade separation at either crossing location would only be beneficial if capacity improvements are incorporated at the upstream and downstream signalized intersections.

Table A.5-1 Total Vehicle Traffic Delay and Percent Increase

Environmental Justice Statistical Analysis

In their comments on the DEIS, USEPA stated that Appendix I in the DEIS should have provided additional information to explain the statistical analysis and conclusions of the Environmental Justice analysis. USEPA asked the following five questions:

- How were the marginal probabilities derived?
- What do the different marginal probabilities demonstrate?
- Why are the marginal probabilities in Tables I.2-2 in Appendix I in the DEIS (Actual noise impacts) and I.2.3 (Expected noise impacts) identical?
- Why are there only 2 tables? Shouldn't there be four: minority/actual; minority/expected; low-income/actual; low income/expected?
- The DEIS states, "Further analysis revealed that the high and adverse train noise impacts are not disproportionately borne by minority or low-income environmental justice populations." What analysis supports that statement?

The following analysis is SEA's response to USEPA's questions. This analysis includes the revisions that are discussed in Section 2.9 of the FEIS.

The environmental justice analysis evaluated the effects on environmental justice populations where high and adverse impacts were identified. SEA completed a statistical analysis using the chi-squared test of independence to determine if the probability of a census block group experiencing high and adverse impacts is independent of a census block group being classified as an environmental justice population. If not statistically independent, then additional analysis is conducted to determine if the impacts are disproportionately borne by the environmental justice populations.

Chi-Squared Test of Independence for Train Noise Impacts Between Minority Groups

The 161 census block groups were categorized into two groups based on degree of train noise impacts: (i) those experiencing no to low impacts from train noise impacts along EJ&E rail lines; and (ii) those experiencing high and adverse impacts as a result of train noise impacts along the EJ&E rail lines. Furthermore, within each of these two groups, the number of minority and non-minority census block groups was determined and provided in Table A (a 2-row by 2-column contingency table).

Marginal probabilities are calculated by dividing the number of census block groups in a row or column by the total number of census block groups. The marginal probabilities reveal that 26% of the census blocks experience a "no to low" noise impact. In addition it reveals that 42% of the census blocks are considered minority.

Table A Minority Environmental Justice Census Block Group Analysis: Actual Train Noise Impacts

	Number of Minority Census Block Groups	Number of non-Minority Census Block Groups	Marginal Probability for Train Noise Impacts
No to Low Impact (ERS 0 or 3)	23	19	26%
High and adverse impact (ERS 5)	44	75	74%
Marginal Probability for Minority/Non-Minority	42%	58%	

A chi-squared test of independence is conducted to determine evaluates whether train noise impacts are distributed independently across minority/non-minority census block groups. The hypothesis is that these impacts are independent.

The next step in the statistical analysis is to determine the expected number of census block counts in the contingency table under the assumption of independence. For example, if independent, the number of census block groups with "no to low" noise impact that are classified as minority should equal the total number of census blocks (e.g., 161) times the marginal probability for "no to low" noise impact (26%) times the marginal probability for minority (42%). This yields an expected count of 17 for "no to low" impact and minority classified. Table B summarizes all expected census block counts.

Table B Minority Environmental Justice Census Block Group Analysis: Expected Train Noise Impacts

	Number of Minority	Number of non-Minority	Marginal Probability for Train Noise Impacts
No to Low Impact (ERS 0 or 3)	17	25	26%
High and adverse impact (ERS 5)	50	69	74%
Marginal Probability for Minority/Non-Minority	42%	58%	

The chi-squared test of independence assesses whether the actual and observed results are statistically "close" and therefore independent. The square of the difference in observed versus expected counts divided by the observed counts are totaled across all 4 cells. In this case, the total is 4.04. Comparing this value to a chi-squared distribution with one degree of freedom, it is determined that the probability that independence exists is only 4.4 percent. Therefore, we can be more than 95 percent certain that census block groups experiencing high and adverse impacts is not independent of environmental justice classifications.

After SEA determined that the two variables are not independent, the ratio of observed environmental justice census block groups with high and adverse impacts to the expected number of environmental census block groups with high and adverse impacts was calculated. A ratio of greater than one would indicate that a high and adverse impact would occur more frequently in environmental justice census block groups. In the case of minority census block groups, the ratio is 0.89 (or 44 divided by 50 from Tables A and B above) and therefore the impacts are not disproportionately borne by minority populations.

Chi-Squared Test of Independence for Train Noise Impacts Between Low Income Groups

The same process was used to ascertain whether train noise impacts were independent of income level. The observed actual and expected census block counts blocks by train noise impact and low income group are provided in Table C and Table D respectively. Again, the square of the difference in observed versus expected counts divided by the observed counts are totaled across all 4 cells. In this case, the total is 0.25. Comparing this value to a chi-squared distribution with one degree of freedom, it is determined that the probability that independence exists is 62 percent. Therefore, we can only be 38 percent certain that census block groups experiencing high and adverse impacts are not independent of the low income environmental justice classification. Since the certainty that census block groups experiencing high and adverse impacts are not independent of the low income environmental justice classification is less than 50 percent, the two variables are statistically independent. As a result, the impacts are not disproportionately borne by low-income populations.

Table C Low-Income Environmental Justice Census Block Group Analysis: Actual Train Noise Impacts			
	Number of Low-Income	**Number of non-Low-Income**	**Marginal Probability for Train Noise Impacts**
No to Low Impact (ERS 0 or 3)	7	35	26%
High and adverse impact (ERS 5)	24	95	74%
Marginal Probability for Income Group	19%	81%	

Table D Low-Income Environmental Justice Census Block Group Analysis: Expected Train Noise Impacts			
	Number of Low-Income	**Number of non-Low-Income**	**Marginal Probability for Train Noise Impacts**
No to Low Impact (ERS 0 or 3)	8	34	26%
High and adverse impact (ERS 5)	23	96	74%
Marginal Probability for Income Group	19%	81%

Biological Resources

SURFACE TRANSPORTATION BOARD
Washington, DC 20423

Section of Environmental Analysis

November 21, 2008

Mr. John D. Rogner, Field Supervisor
Chicago Ecological Services Field Office
U.S. Fish and Wildlife Service
United States Department of the Interior
1250 South Grove Avenue, Suite 103
Barrington, IL 60010

Re: STB Finance Docket No. 35087, Canadian National Railway Company and Grand Trunk Corporation – Control – EJ&E West Company; Submission of Biological Report and Request for Concurrence

Dear Mr. Rogner:

In response to the comment letter on the Draft EIS submitted by the Department of Interior (DOI) on September 29, 2008, and subsequent conference calls, meetings, and site visits, the Surface Transportation Board, Section of Environmental Analysis (SEA) is submitting the enclosed Biological Report.

The purpose of the Biological Report is to help us answer this question: to what extent could the Proposed Action (which is Canadian National Railway Company's proposed acquisition of the Elgin, Joliet & Eastern Railway Company) and transaction-related constructions affect Federally threatened, endangered, candidate, or proposed species, and designated or proposed critical habitat? We believe that the Biological Report answers this question, using the best scientific and commercial information available.

Five species (Indiana bat, Hine's emerald dragonfly, Karner blue butterfly, Eastern prairie fringed orchid, and leafy prairie clover) are evaluated in the Biological Report because preliminary information indicated that they do occur or might occur in or near the area of the Transaction. An additional four plant species (Mead's milkweed, Prairie bush clover, Lakeside daisy and Pitcher's thistle) were eliminated from further consideration because they do not presently occur in proximity to the area of proposed activity, or because they occur only in areas where no construction or operational impacts are reasonably anticipated.

After a detailed review of the available information, and completion of habitat-level field surveys, SEA has made a determination of "may affect but is not likely to adversely affect" for all five species evaluated in the Biological Report. For the Eastern prairie fringed orchid, the Applicants have agreed to conduct pre-construction surveys, and SEA will re-initiate

consultation if orchid species are found within an area of proposed activity. For the Hines' emerald dragonfly, Applicants have submitted a voluntary mitigation measure that would require CN to cooperate with its rail customer, Midwest Generation, to ensure that Midwest would receive coal deliveries on time and when needed, thus negating the need for Midwest to expand its existing Romeoville siding into Hines' emerald dragonfly habitat.

We request your review of and concurrence with SEA's conclusions within the enclosed Biological Report. Please provide a copy of your response as soon as possible to Phillis Johnson-Ball of my staff and to our independent third-party consultant, John Morton, at HDR, 8404 Indian Hills Drive, Omaha, Nebraska, 68114-4098.

Thank you for your continued assistance and your willingness to work with us to help us meet our obligations under the Endangered Species Act.

Sincerely

Victoria Rutson
Chief
Section of Environmental Analysis

INTRODUCTION

The purpose of this biological report is to review the proposed Canadian National Railway Company acquisition of the Elgin, Joliet & Eastern Railway Company and Transaction-related connections and double-track in sufficient detail to determine to what extent the Proposed Action and Transaction-related construction may affect any of the Federally threatened, endangered, candidate, or proposed species and designated or proposed critical habitats listed below. The following information is provided to comply with statutory requirements to use the best scientific and commercial information available when assessing the risks posed to Federally listed, and/or candidate or proposed species, and designated and/or proposed critical habitat by proposed Federal actions.

Threatened, Endangered, Proposed Threatened, or Proposed Endangered Species

Based on correspondence from Illinois and Indiana U.S. Fish and Wildlife Service (USFWS) and a preliminary review of available information on endangered and threatened species in the greater Chicago region, the following five listed species may be affected by the Proposed Action and Transaction-related construction:

- Indiana bat (*Myotis sodalis*) **Endangered**
- Hine's emerald dragonfly (HED) (*Somatochlora hineana*) **Endangered**
- Karner blue butterfly (KBB) (*Lycaeides melissa samuelis*) **Endangered**
- Eastern prairie fringed orchid (EPFO) (*Platanthera leucophaea*) **Threatened**
- Leafy prairie clover (*Dalea foliosa*) **Endangered**

These species are addressed in greater detail in the body of this document.

Four additional listed species were eliminated from further consideration after preliminary review:

- Mead's milkweed (*Asclepias meadii*) (T) is not currently known to exist within the EJ&E rail line vicinity except for possibly introduced populations. The nearest known extant natural populations are in southern Illinois, in Saline County, and in south-central Iowa. The species has been extirpated in Wisconsin and Indiana (USFWS, 2003b). The last known natural population in the northern part of Illinois, in Ford County, was destroyed in 2001 (Bowles, 2001). Mead's milkweed has been introduced into a number of prairie restorations in Illinois and Indiana in recent years including at a few locations in the Chicago region. An introduced population in DuPage County is 1,500 feet from the rail line and well outside the Action Area (defined below). An introduced population at Vermont Cemetery Prairie in Will County has apparently been extirpated (S. Cirton, USFWS biologist, pers. comm.) and potential habitat is separated from the project area by a road and will not be disturbed. No new construction is proposed near either of these locations.
- Prairie bush clover (*Lespideza leptostachya*) (T) is present at a preserve in northwest Cook County, but the population is more than 4,000 feet from the nearest rail line and is well outside the Action Area.

- Lakeside daisy (*Hymenoxys acaulis* var. *glabra*) (T) is present in Will County but populations are well studied and are outside the Action Area.
- Pitcher's thistle (*Cirsium pitcheri*) (T) historically occurred in the vicinity of EJ&E Segment 1 and Kirk Yard. The thistle was last recorded in the Study Area in 1909 in Lake County, Indiana.

The Proposed Action will have no affect on these four species.

Candidate, Proposed and Sensitive, and Species of Concern

No Federally listed candidate or proposed species occur in the Action Area.

Numerous state-listed and state species of concern are known to be, or may be present in or near the Action Area. These species were addressed in Sections 3.11 and 4.11 in the Draft EIS for the Proposed Canadian National Railway Company Acquisition of the Elgin, Joliet & Eastern Railway Company. Potential impacts to these species are not further addressed in this Biological Report.

Critical Habitat

Critical habitat was designated for the Hine's emerald dragonfly effective September 5, 2007 (USFWS 2007). Portions of the lower Des Plaines River Valley, including parts of the Action Area, are included within the area designated as critical habitat for this species.

Indiana bat Critical Habitat has been designated only for hibernacula. The nearest designated critical habitat is in LaSalle County, Illinois, well outside the Action Area.

The action addressed within this document does not fall within critical habitat for any other species.

CONSULTATION TO DATE

In a letter dated September 29, 2008, the USFWS, through the Department of the Interior, requested that SEA either provide additional information for informal consultation or initiate formal consultation (USFWS, 2008; Attachment A). After discussions at a meeting held on October 23rd, 2008, USFWS agreed to continue with informal consultation pending collection of additional information. After two field meetings (October 29, 2008 and November 6, 2008), the USFWS, on November 7th, 2008, agreed that formal consultation would not be necessary at this time, pending the receipt of additional information. This biological report has been prepared to document the information gathered during this process. Though not intended to function as a formal biological assessment, it generally follows the format of a biological assessment.

A brief timeline of activities to date follows:

- **January 23, 2008** – Illinois agency scoping meeting.
- **January 24, 2008** – Indiana agency scoping meeting.
- **January 25, 2008** – USFWS in Illinois and Indiana contacted for information on natural resources within the Study Area.
- **February 8, 2008** – Letter received from Illinois USFWS.

- **February 12, 2008** – Follow-up email to phone calls to Liz McCloskey (Indiana USFWS) and Shawn Cirton (Illinois USFWS) requesting natural resource information.
- **February 18, 2008** – Scoping letter and natural resource materials received from Indiana USFWS.
- **March 5, 2008** – Shawn Cirton (USFWS) was contacted to see if there were any other resources (maps, reports, journal articles, web sites, etc.) the USFWS may be able to provide for us to complete our analysis for the Draft Environmental Impact Study (EIS). Also talked about several of the endangered species. Mr. Cirton indicated the Mead's milkweed population at Vermont Cemetery Prairie Nature Preserve in Will County is no longer deemed viable by the USFWS. In response to discussion about migratory birds and the impacts of noise, Mr. Cirton agreed there were very few studies that specifically address railroad noise impacts. He did indicate that vehicle noise is well studied and provided a link to FHWA's website.
- **March 5, 2008** – Jeff Mengler was contacted to discuss issues related to the HED. Jeff has headed up the ROW Management Team for a period of 8-10 years and is involved with HED and the development of a Habitat Conservation Plan (HCP) for the species. The ROW Management Team has now merged into the HCP group. The goal of the HCP is to provide a broad scale, cohesive plan for all parties. The HCP covers impacts of continued activities and provides an incidental take permit to the private entities (Com Ed, Hansen Material Services Company, Midwest Generation, and EJ&E) while providing more comprehensive mitigation strategies that benefit the HED. The HCP is not published yet, but a draft may be ready in about a month. Jeff mentioned that the EJ&E spur is very old and is not built to current rail standards and the track actually "floats on the surface." He indicated the spur has a storied history, in that COM Ed and the Metropolitan Water Reclamation District (MWRD) own the ROW, while Midwest Generation actually owns the tracks. EJ&E only provides operation and delivery of goods. Rail Works does all of the maintenance on the tracks. Mr. Mengler described the current status of the HED, and indicated the presence of larval naiads within mere feet of the rail bed. Jeff stated that operation of the line is restricted to between 4-6 mph to reduce mortality to adults, but indicated the impacts to larval habitat from hydraulic pumping and sediment releases has continued and is still a major threat to the existence of the species. Vibration of the tracks and vertical deflection causes native sediments to "squirt" from the rail bed into the cracks and fissures in the dolomite. Groundwater from the recharge area west of the site constantly flows under the tracks and numerous measures (new culverts, French drains, etc.) have not stopped this problem from occurring. Mr. Mengler indicated the ROW Management team has no good summary documents of the ROW Management team activities and stated there are file cabinets full of data and would need to visit the USFWS to sift through the documents.
- **April 24, 2008** – First natural resources stakeholder meeting in Illinois
- **April 30, 2008** – First natural resources stakeholder meeting in northern Indiana
- **July 25, 2008** – Draft EIS issued
- **September 2, 2008** – Second natural resources stakeholder meeting in Illinois

- **September 3, 2008** – Second natural resources stakeholder meeting in northern Indiana
- **September 4, 2008** – Natural resources stakeholder meeting in Indianapolis
- **September 29, 2008** – Date of Department of Interior's response letter to the Draft EIS; the USFWS requests formal consultation based on their review
- **October 10, 2008** – Begin preparation of Biological Assessment
- **October 18, 2008** – Site visit (HED habitat) by HDR and Winzler & Kelly
- **October 23, 2008** – Meeting attended by USFWS, HDR, Winzler & Kelly, SEA (via phone) and CN to discuss project related endangered species issues. Agreement to continue with informal consultation on the HED and to conduct habitat surveys for EPFO
- **October 29, 2008** – Field meeting attended by Indiana USFWS, The Nature Conservancy (TNC), INDNR, HDR, Winzler & Kelly, and CN to discuss Indiana sites
- **October 30, 2008** – Hi-rail survey of EJ&E rail line by HDR, Winzler & Kelly, CN, and EJ&E to identify potential EPFO habitat
- **November 6, 2008** – Field visit by HDR and Illinois USFWS to assess habitat suitability for EPFO in Transaction-related construction areas in Illinois
- **November 7, 2008** – Meeting with USFWS, HDR, SEA, Midwest Generation, and CN and to discuss HED and EPFO issues, resulting in an agreement that formal consultation would not be necessary

DESCRIPTION OF THE PROPOSED ACTION

Background Information

The Applicants are Canadian National Railway Company and Grand Trunk Corporation (contact is Devin Sprinkle, Regional Manager – Environment, CN). The Federal Action is consideration to acquire control of the EJ&E West Company, which is a wholly-owned noncarrier subsidiary of EJ&E. The Surface Transportation Board would be authorizing the activity and is the Action agency (contact is Victoria J. Rutson, Chief, Section of Environmental Analysis and Phillis Johnson-Ball, Deputy Chief, Section of Environmental Analysis).

On October 30, 2007, the Applicants filed an application with the Surface Transportation Board (the Board) seeking its approval to acquire control of EJ&E West Company, a wholly owned noncarrier subsidiary EJ&E. The Applicants propose to acquire control of EJ&E West Company and to use EJ&E's main rail line to connect all five of CN's rail lines in the Chicago, Illinois metropolitan area (herein referred to as the Proposed Action). The EJ&E main line, located in northeastern Illinois and northwestern Indiana, extends in an arc around Chicago as follows:

- From Waukegan, Illinois, southwest to Joliet, Illinois
- From Joliet eastward to Gary, Indiana
- From Gary northwest to Chicago, along Lake Michigan

Figure 1, Project Vicinity (on the next page), shows the existing CN and EJ&E rail systems.

Environmental Impact Statement
Figure 1
Project Vicinity

The Applicants attribute delays in Chicago to congested rail lines and too much dependence on the BRC Clearing Yard for switching traffic between rail subdivisions. Most of the Class I freight railroads in Chicago now use the BRC Clearing Yard for train classification. According to the Applicants, acquisition of Kirk Yard and other EJ&E yards located along the EJ&E main line and near the edge of the congested Chicago Terminal District would permit CN to use these yards to classify and switch trains passing through the Chicago metropolitan area. The Applicants state that the Proposed Action would allow trains that stop in the Chicago metropolitan area for crew changes, locomotive inspections, and set-outs to use the EJ&E main line, and Kirk and East Joliet yards. The Applicants expect this to reduce the number of CN trains that, though bound for other destinations, would otherwise need to travel into Chicago. The Proposed Action is expected to reduce classification work at CN's Glenn, Hawthorne, and Markham yards and at the BRC Clearing Yard.

Under the Applicants' Proposed Action, EJ&E would transfer all of its land, rail, and related assets west of the centerline of Buchanan Street in Gary, Indiana, to EJ&E West Company. These assets include EJ&E's main line as well as double-track, branch lines, and yards. At that time, EJ&E West Company would become a rail common carrier. EJ&E would retain its land, rail, and related assets east of the centerline. If the Board approves the Proposed Action, EJ&E would change its name to Gary Railway Company and EJ&E West Company would assume the Elgin, Joliet and Eastern Railway Company name.

CN would shift much of the rail traffic currently moving over CN's rail lines in Chicago to the EJ&E main line. Rail traffic on CN rail lines inside the EJ&E arc would generally decrease, and those areas would see environmental benefits. The number of trains operating on the EJ&E main line outside Chicago would increase by approximately 15 to 24 trains per day, resulting in potential adverse effects. The Proposed Action would also involve construction of six short rail connections for operational efficiency. CN would construct these connections within, or very close to, existing rail right-of-way (ROW). In addition, CN would construct five segments of siding extensions, or second mainline track (double-track), totaling approximately 19 miles, within existing ROW. The Applicants state that they do not anticipate any rail line abandonments in conjunction with the Proposed Action (Canadian National, 2007).

Project Objectives

The Applicants give three primary reasons for seeking to acquire control of the EJ&E rail assets (Federal Register, 2007; Canadian National, 2007):

- To improve the Applicants' operations in and beyond the Chicago metropolitan area by providing a continuous rail route around Chicago, under CN's ownership, that would connect its five rail lines radiating from Chicago.
- To make EJ&E's Kirk Yard, as well as smaller facilities at Joliet, Illinois, and Whiting, Indiana, available to the Applicants, thus enabling them to consolidate rail car classification work, thereby reducing the use of the BRC Clearing Yard.
- To enable the CN system to benefit from an important supply line EJ&E provided for North American steel, chemical, and petrochemical industries, as well as utility

companies, thereby allowing the Applicants to develop more extensive relationships with these industries and the companies that serve them.

The Proposed Action is intended to contribute to the implementation of these goals.

Project Description

Proposed Action

The Applicants are seeking the Board's authorization, under 49 USC 11323-11325, to acquire control of EJ&E's land, rail line, and related assets. Under the Proposed Action, the Applicants would redirect trains from the five CN subdivisions in Chicago to the EJ&E rail line, increasing the volume of freight rail traffic along the EJ&E rail line, which would result in a corresponding decrease in the volume of freight rail traffic along the CN subdivisions. Figure 2, below, shows the proposed changes in rail traffic volume.

The Proposed Action would also result in: 1) the construction of six new rail connecting tracks between existing rail lines at Munger (near Wayne, Illinois), Joliet, Illinois, and Matteson, Illinois and at Griffith, Indiana, Ivanhoe (in Gary, Indiana), and Kirk Yard in Gary, Indiana; 2) the construction of five segments totaling 19 miles of double-track (parallel track) to augment the existing single track, at or near Leithton, Illinois (near Mundelein, Illinois); Diamond Lake Road to Gilmer Road near Mundelein, Illinois; East Siding to Walker, Illinois (two segments) near Aurora, Illinois, Naperville, Illinois, and Plainfield, Illinois; and East Joliet to Frankfort, Illinois; and 3) an increased use of Kirk Yard and East Joliet Yard for rail car classification and train assembly and disassembly.

Although the proposed construction activities and changes in yard operations do not require prior Board approval, SEA analyzed the potential environmental impacts of these related actions because they would not occur but for the Proposed Action. Figure 3, below, shows the locations of the proposed new double-track construction, the connecting tracks between existing rail lines, and the location of Kirk Yard and East Joliet Yard. Figure 4, below, shows a typical cross section for areas that would have new connections.

Connecting Tracks between Existing Railroad Lines and Double Track

SEA conducted an independent examination of the Applicants' six proposed connecting tracks between existing railroad lines to determine if alternative locations or configurations would meet the purpose of, and need for, the Proposed Action while minimizing potential environmental effects. For each connection, SEA considered the Applicants' proposed connection, a No-Build Alternative, and alternative configurations developed by SEA where appropriate. Including the No-Build Alternative, SEA considered five alternatives for the proposed connection at Munger (near Wayne, Illinois), three alternatives at Joliet (near Joliet, Illinois), four alternatives for the proposed connection at Matteson (near Matteson, Illinois), and two alternatives at Griffith (near Griffith, Indiana), Ivanhoe (in Gary, Indiana), and Kirk Yard (near Gary, Indiana). SEA also developed tailored environmental mitigation for the six connections.

Environmental Impact Statement

Figure 4

Typical Cross Section for Areas with New Connections

The Proposed Action would also result in: 1) the construction of six new rail connecting tracks between existing rail lines at Munger (near Wayne, Illinois), Joliet, Illinois, and Matteson, Illinois and at Griffith, Indiana, Ivanhoe (in Gary, Indiana), and Kirk Yard in Gary, Indiana; 2) the construction of five segments totaling 19 miles of double-track (parallel track) to augment the existing single track, at or near Leithton, Illinois (near Mundelein, Illinois); Diamond Lake Road to Gilmer Road near Mundelein, Illinois; East Siding to Walker, Illinois (two segments) near Aurora, Illinois, Naperville, Illinois, and Plainfield, Illinois; and East Joliet to Frankfort, Illinois; and 3) an increased use of Kirk Yard and East Joliet Yard for rail car classification and train assembly and disassembly.

Although the proposed construction activities and changes in yard operations do not require prior Board approval, SEA analyzed the potential environmental impacts of these related actions because they would not occur but for the Proposed Action. Figure 3, below, shows the locations of the proposed new double-track construction, the connecting tracks between existing rail lines, and the location of Kirk Yard and East Joliet Yard. Figure 4, below, shows a typical cross section for areas that would have new connections.

Connecting Tracks between Existing Railroad Lines and Double Track

SEA conducted an independent examination of the Applicants' six proposed connecting tracks between existing railroad lines to determine if alternative locations or configurations would meet the purpose of, and need for, the Proposed Action while minimizing potential environmental effects. For each connection, SEA considered the Applicants' proposed connection, a No-Build Alternative, and alternative configurations developed by SEA where appropriate. Including the No-Build Alternative, SEA considered five alternatives for the proposed connection at Munger (near Wayne, Illinois), three alternatives at Joliet (near Joliet, Illinois), four alternatives for the proposed connection at Matteson (near Matteson, Illinois), and two alternatives at Griffith (near Griffith, Indiana), Ivanhoe (in Gary, Indiana), and Kirk Yard (near Gary, Indiana). SEA also developed tailored environmental mitigation for the six connections.

Under the Proposed Action, the Applicants propose construction of 19 miles of double-track and changes in yard operations within the existing EJ&E rail line ROW. No feasible alternatives to the double-track or yard operations were identified by SEA. Therefore, SEA did not analyze alternatives to the planned construction of double-track or changes to yard operations.

Action Area

In defining the Action Area, factors considered included construction activity and changes in levels of operational activity, and associated potential direct and indirect impacts.

The Action Area as discussed in this document includes a 500-foot corridor on either side of all northeast Illinois and northwest Indiana CN and EJ&E rail lines where there are proposed operational changes or Transaction-related construction of connections or double-track as shown in Figures 1 through 3. The 500-foot limit includes areas subject to direct proposed construction impacts as well as noise, vibration, hydrology, or other direct or indirect potential impacts.

STATUS OF THE SPECIES IN THE ACTION AREA

Indiana Bat

Overview

The Indiana bat (*Myotis sodalis*) is relatively small and nondescript, dull dark brown or grayish-brown. The species is distinguished from the similar *Myotis lucifugus*, which is common near the Action Area, by the presence of a keel on the calcar, hairs on the toes and foot not extending beyond the tip of the claws, and dull rather than glossy fur (Hoffmeister, 1989).

Life History

Indiana bats hibernate for the winter, generally October through April (LaVal and LaVal, 1980), in a limited number of caves or mines with very specific temperature and humidity conditions. Upon arriving at the caves in August or September, bats swarm each evening for a period of up to several weeks. Mating occurs during this time. Males are mature in their second year, females in their first autumn (USFWS, 2007a).

Dispersal occurs in the spring, with females emerging first. Some individuals can potentially migrate considerable distances. In Illinois, females reach summer habitat beginning in mid-April (Gardner et al, 1991a) and possibly into mid-May. The female gives birth to a single young.

Maternity colonies usually contain less than 100 bats (USFWS, 1999). Roosts are established under the exfoliating bark of dead or, in some cases, living trees. Young Indiana bats are able to fly about a month after birth, usually by mid-to-late July (Clark et al, 1987) or early August (Gardner et al, 1991a; Brack, 1983).

Indiana bats forage on a wide variety of flying insects; the composition of the diet varies depending on location, season, and individual condition (USFWS, 2007a).

Population Dynamics

Indiana bat population size has dropped dramatically over the past 40 years; much of the decline which took place from the 1960s through the 1980s has been attributed to human disturbance of hibernating caves, including vandalism and intentional modification of cave entrances. However, recent declines are less well understood (USFWS, 2007a).

Natural factors including flooding and cave collapse, sometimes aggravated or induced by off-site disturbances; and unusually cold weather, have also affected some populations (USFWS, 2007a).

The total Indiana bat population was estimated at 353,000 individuals in 1997 (USFWS, 2007a). Kentucky and Missouri experienced big population declines since the first surveys in 1960, but estimated numbers have increased for Indiana and a few other states. Illinois supports a relatively small portion of the population. Estimated Illinois population sizes have been 4,140 (1960), 3,990 (1980) and 4,530 (1995-97) (USFWS, 2007a).

Because Indiana bats congregate in such large numbers to hibernate, they are subject to occasional catastrophic events, both natural and human induced, capable of decimating regional populations. Relatively low fecundity limits the potential recovery rate.

Habitat

Hibernating caves or mines maintain a narrow temperature range, optimally 3 to 6 degrees C, during mid-winter in the areas utilized by bats. Hibernating sites have a low risk of freezing, but are also unlikely to rise above levels that might raise metabolism enough to exhaust fat reserves before the end of winter. Humidity is usually above 74 percent at hibernating sites, although exceptions are known (Humphrey, 1978). Relatively few caves or mines are known to maintain low and stable temperatures within the suitable range.

Summer habitat is less understood. Floodplain and upland forest are used for roosting, with foraging occurring in these communities and in nearby old fields and pastures with scattered trees (Gardner et al., 1991b; Callahan et al., 1997). Dead or dying trees, or living trees with loose or exfoliating bark, are used for roosts. Certain kinds of disturbance (damage from hogs, mine subsidence) can actually create habitat by killing mature trees, and this may be important in areas which consist largely of even-age stands.

It has been suggested that the Indiana bat may be a savanna species, especially in the western part of the range, and this may help to explain the apparent tolerance of fragmented forest landscapes (USFWS, 2007a). Most unmanaged savanna remnants are now badly overgrown as a result of fire suppression.

A wide variety of tree species are used for roosting, as long as the appropriate structure of loose, exfoliating bark is present (Gardner et al., 1991a; Callahan, 1997). Roost trees tend to be large and isolated, or located at the edge of woodlots, and in areas with an open canopy and understory (USFWS, 1999). Maternity colonies use one to three primary roost trees, with a number of alternate roost trees (up to 17) nearby. Choice of roost trees may be influenced at least in part by thermoregulation needs (USFWS, 2007a; Callahan et al. 1997).

Trees with exfoliating bark are an ephemeral resource, with dead trees maintaining suitable conditions for not more than a few years. A few tree species, including slippery elm, cottonwood, green ash, certain oaks, and hickories may provide useful habitat for four to eight years (Gardner et al. 1991a; Callahan et al. 1997; USFWS, 2007a). Indiana bats return to the same roosting areas over time, with females sometimes returning to the same tree in subsequent years (Humphrey et al., 1977). Good habitat includes a number of roost trees within the maternity colony vicinity (Kurta et al., 1993, Callahan et al., 1997), thus allowing bats to move among trees in response to changing weather conditions or loss of individual trees to natural or unnatural factors.

Foraging occurs along riparian forest, and to a lesser extent among open canopy of upland forest or in early successional fields, along wooded fencerows, or over farm ponds (Clark et al., 1987; Gardner et al., 1991b). Cope et al., (1987) identified wooded riparian corridors of at least 30 meters (98.4 feet) width on each side of a stream as excellent foraging habitat. Foraging areas may be up to 2.5

kilometers (1.55 miles) from upland roosts (Gardner et al. 1991b). Areas of riparian forest 0.8 to 1.2 kilometers (0.5 to 0.75 miles) in length are used for foraging (Humphrey et al. 1977; Cope et al. 1978; Gardner et al. 1991b).

Rangewide Status

The Indiana bat occurs through much of the lower Midwestern and northeastern U. S. However, winter habitat (hibernating caves) is limited to a few states, with as much as half the population wintering in Indiana. Eighty-five percent of the population winters in nine 'Priority One' caves, three each in Indiana, Kentucky, and Missouri.

Garner and Gardner (1992) summarized the Illinois distribution of the Indiana bat, based on their own work and a review of earlier literature. Counties where reproductive females or juveniles had been reported up to that time included: Adams, Bond, Jackson, Johnson, Perry, Pike, Pulaski, Schuyler, Scott, Union, and Wabash/Edwards. Garner and Gardner (1992) sampled 190 sites in 75 Illinois counties and documented the presence of Indiana bats at 48 sites (25.3%), including new records for 13 counties. All but three of these (Vermilion, Ford, and Henderson) were in southern Illinois.

In Illinois, 'Priority Two' hibernacula (more than 500 bats) are present in: Jackson, LaSalle, and Monroe Counties. 'Priority Three' hibernacula are known in: Adams, Alexander, JoDaviess, Johnson, Madison, Pike, Pope, and Union Counties.

The Indiana bat was listed as endangered on March 11, 1967, and it has retained that status because of a continued and accelerated decline in total numbers, especially in certain parts of the range.

Project Area Status

The Indiana bat is present within the floodplain of the East Branch of the Little Calumet River in Porter County, where a maternal roosting colony is known approximately 17 km east of the EJ&E crossing of the Little Calumet River. No other recent records are known from the immediate region.

Hine's Emerald Dragonfly

Overview

The Hine's emerald dragonfly (HED) (*Somatochlora hineana*) is a moderately large species, with a wingspan of 3.5 to 3.7 inches (90-95 mm) and a body length of 2.3 to 2.5 inches (60-65 mm). The body is dark chocolate brown to dark metallic green, with a pair of yellow lateral stripes on each side. The eyes are bright green (brown for the first day or two in teneral (newly emerged) individuals. The wings are clear and without large or obvious markings.

The larval form is robust, brown, with size depending on age and possibly temperature range and food supply. Cashatt and Vogt (2001) provide a detailed description

Life History

HED spends most of its life as an aquatic larva. The exact length of the larval phase may vary depending on water temperature, food supply, or other factors, but is thought to last for at least two to

five years (Soluk et al., 1996, 1998; Soluk and Satyshur, 2005). Larval HED are sit-and-wait predators, relying on cryptic coloration to hide among detritus and capture passing prey (USFWS, 2001). Their ecology appears to be linked with the ecology and behavior of the burrowing "devil" crayfish (*Cambarus diogenes*). The burrows of the devil crayfish provide refuges for HED larva from dry conditions in mid to late summer, and from temperature extremes in winter (Soluk et al., 2007).

Adults emerge in the summer months, normally from June to August. In northeastern Illinois the peak of adult emergence normally occurs in July, with some variation related to temperature and precipitation patterns. Teneral adults may perch on wetland vegetation, shrubs, or trees for up to several hours after emergence. The adults are thought to survive for up to at least several weeks although little precise information is available for this species; survival of individual adult HEDs for a minimum of 14 days has been documented (Mierzwa and Smyth, 1995).

Adult males establish territorial patrols over suitable wetland habitat including small open channels in marsh or sedge meadow. Males fly slowly back and forth within or just over the bordering vegetation; patrols may last from a few seconds to at least several minutes. Males sometimes move back and forth between multiple nearby locations.

Mating occurs on the wing; afterwards females may deposit more than 500 eggs in shallow water or soft mud. The length of time to hatching may be variable.

Population Dynamics

HED occurs in distribution patterns consistent with a regional metapopulation model although detailed information is limited to a few of the better studied sites (Mierzwa and Smyth, 1995). Illinois populations inhabit an approximately 17 km (10.6 mile) length of the Des Plaines River Valley, with the largest populations in the southern part of the area. Historically, good quality foraging habitat probably occurred through most of the area with exposed or near-surface dolomite and cool shallow wetlands. However, optimal breeding sites are less regularly distributed and depend on the presence of seepage outlets, gradient, and appropriate vegetation structure. At least some movement occurs between these breeding sites. During a 1995 study, four dragonflies out of 180 marked (2.2 percent) moved between sites; movements between Lockport Prairie, River South Parcel, and Middle Parcel were documented (Mierzwa and Smyth, 1995). Today the once nearly continuous habitat in the river valley has been fragmented, primarily by past industrial use.

Distribution is typically described using preserve or site names; however this can be somewhat misleading. For example, Lockport Prairie Nature Preserve and the privately owned River South Parcel include multiple documented breeding sites, and numerous locations with documented male territorial patrols. Other Illinois localities include only very small areas of potential breeding habitat, and in some cases successful reproduction remains unverified.

Some breeding sites are relatively reliable, and support larvae in most years. However breeding sites are subject to stochastic disturbances of different types and at different frequencies. Sites in lower parts of the floodplain are slower to dry, but subject to frequent flooding by the Des Plaines River;

some seepage fed sites near the bluff base are relatively reliable but slow to recharge after severe and prolonged drought, while others respond rapidly to rainfall events.

There is considerable annual fluctuation in adult population size. Long term monitoring at River South Parcel (1995-2008) noted densities ranging from 0.20 to 6.91 adult dragonflies per hectare (Mierzwa, 2008a). At the much smaller Middle Parcel, density estimates ranged from 0.00 to 6.06 dragonflies per hectare. Estimating actual adult population size is difficult because of multiple cohorts of emergence and a lack of information on individual adult life spans, but conservative minimum population estimates for River South Parcel ranged from 9 to 308 adult dragonflies (Mierzwa, 2008a). An attempt to estimate adult density at other Illinois sites was made in 1995, using randomly located transects at all eight populations identified up to that time; density estimates were obtained for Lockport Prairie (1.22/ha.) and Long Run Seep (0.51/ha.) as well as for the Hanson Material Service sites cited above. No observations were made on transects at the other four localities (Romeoville Prairie, Black Partridge, Waterfall Glen, and McMahon Woods), thus adult populations were below detection levels for the methods and level of effort employed (Mierzwa and Smyth, 1995).

Larval population sizes are presumably much larger at any given time, represent multiple age classes, and may be somewhat more stable.

Considerable annual variation in adult population size appears to be characteristic of this species. The relatively high fecundity of individual adult females holds the potential for rapid population growth when reasonably stable conditions are present over several consecutive years for the aquatic larvae, or when habitat diversity accounts for variation in hydrological cycles.

Habitat

HED inhabits locations where shallow soils overlie dolomite bedrock, and where cool groundwater feeds shallow emergent wetlands. Breeding occurs in small channels or rivulets through marshes, typically with slow flow and organic detritus on the channel bottoms; and in small pools or soft organic substrate fed by sheet flow through sedge meadows and fens. Larvae may retreat into crayfish burrows during dry spells (Soluk et al, 2007). Ponds or other deep or warm water areas are generally not utilized. Breeding hydrology is influenced by within-site factors as well as by conditions over a much larger ground watershed.

Adults forage in proximity to breeding sites, utilizing a variety of open habitats including marsh, sedge meadow, graminoid fen, dolomite prairie, and successional field. Areas with a break in vegetation height, for example *Typha* marsh adjacent to sedge meadow, or a tree/shrub edge adjacent to marsh, tend to be favored (Nuzzo, 1995). Dragonflies sometimes forage within open portions of floodplain forest and may perch in trees especially on windy days, but they are not present in the interior of dense shrub or sapling thickets which offer limited room for flight. Vegetation structure appears to be more important than vegetation quality for foraging habitat (Nuzzo, 1995); however, high-quality wetland complexes offering a diverse mosaic of vegetation types tend to provide suitable structure.

Rangewide Status

Originally described from sites in northwestern Ohio (Williamson, 1931), the HED is currently known from localities in northeastern Illinois, eastern Wisconsin, the upper peninsula of Michigan, and a portion of the Missouri Ozarks. Single specimens, possibly transients, are available from Indiana and Alabama.

Illinois populations are limited to a small portion of the lower Des Plaines River valley in Will, DuPage, and Cook Counties. The presence of *Somatochlora hineana* in the region was confirmed in 1987 (Vogt and Cashatt, 1994), and extensive studies have since been conducted. All known populations are confined to the floor of the river valley where as a result of post-glacial scouring dolomite is at or near the surface, or to immediately adjacent seepage areas on slopes.

Somatochlora hineana was added to the Federal list of endangered species effective January 26, 1995 (Shumate, 1995). Reasons for listing included limited distribution and need for protection because of threats related to habitat fragmentation and destruction, and changes in groundwater hydrology.

New populations have been identified since the original listing. However, some populations have since been reduced in size

Project Area Status

The two largest Illinois populations are at the Hanson Material Service River South Parcel, and at the Forest Preserve District of Will County's Lockport Prairie Nature Preserve, both on the west side of the Des Plaines River and both straddling the EJ&E Paul Ales Branch line. A much smaller population is known from the Hanson Material Service Middle Parcel, located west of the Paul Ales Branch line, and separated from it by an expanse of weedy successional field on old fly ash fill material.

Extensive information on population density and habitat use is available for the Hanson Material Service sites (Mierzwa, 2008a). Density has been relatively low in recent years, at least in part because of several years of drought conditions; numbers increased slightly in 2007-2008, but remain toward the low end of the documented range (Mierzwa, 2008a). Lockport Prairie was monitored in 1995, and at that time supported a large and high density population (Mierzwa et al., 1995). More recently, quantitative larval monitoring (Soluk et al., 2006) and qualitative adult observations suggest that the Lockport Prairie population is also currently at low density.

A smaller breeding site has been documented approximately 1.0 km south of Lockport Prairie, near the Crest Hill Wastewater Treatment Plant (WWTP) and along the Des Plaines River. Adult observations have been reported west of this location along the Paul Ales Branch line, at or near the WWTP entrance, in 2004 and 2007 (USFWS, 2008; D. Soluk, University of South Dakota, Professor of Biology, pers. comm.). "Many" adults have been reported moving along the rail line here, more than would be expected to originate from the small WWTP breeding site, implying that these observations represent adults dispersing from the Lockport Prairie site to the north (D. Soluk, University of South Dakota, Professor of Biology, pers. comm.). These southernmost observations are within a short distance, 150 meters, of EJ&E segment 9B.

On the east side of the river, Long Run Seep Nature Preserve is located on the valley slope east of New Avenue and CN's Joliet Subdivision rail line. Monitoring in 1995 documented high dragonfly density at this site, but a relatively small total population size is limited by the small size of the preserve (Mierzwa et al, 1995). More recently a small population has been well documented at the Hanson Material Service Long Run/Com Ed parcel located northwest of the nature preserve. Although successful breeding remains undocumented at this location, territorial males have been observed on numerous occasions including within a sedge meadow immediately west of the Joliet Subdivision rail line in the northeast corner of the site (Mierzwa, 2008b).

A few individual observations of adult dragonflies have been made south of this area, at Lockport Prairie East and the adjacent Dellwood Park West. Because no suitable breeding habitat has thus far been identified at these sites, the observations are believed to represent individuals dispersing from Lockport Prairie or Long Run Seep.

Karner Blue Butterfly

Background

The Karner blue butterfly (*Lycaeides melissa samuelis*) (KBB) is a small (wingspan 0.9 to 1.25 inches) butterfly. Males are silvery-blue to dark blue above, with dark wing margins; females are grayish-brown, with dark wing margins bordered on the inside by irregular orange bands. Both sexes are slate gray below, with orange bands and black spots with white margins (Shull, 1987).

Life History

The KBB is bivoltine, having two generations per year. First brood eggs overwinter, hatching in mid-to-late April. Larvae pass through four instars while feeding over a span of several weeks, and pupate in late May to early June. Pupation lasts from 7 to 11 days (Dirig, 1976). First flight adults are present from late May through late June (Swengel and Swengel, 1996), although individual adults may live for an average of only four or five days; maximum adult lifespan may be two to three weeks (USFWS, 2003a). Females deposit eggs on lupine plants or in nearby leaf litter.

Eggs hatch in five to 10 days, with second brood larvae present on lupine from early June through late July. Second brood adults have been observed from early July through late August, and in some years into early September. Second broods may be considerably larger than first broods, possibly because of over overwintering mortality of first brood eggs (USFWS, 2003a).

Larvae are tended by ants. The presence of ants is reported to substantially decrease predation rates on larvae (Savignano, 1994).

Population Dynamics

The KBB is a classic example of a metapopulation associated with a temporally and spatially dynamic habitat type. Populations may be extirpated by wildfire, gradual canopy closure, or a variety of other causes, and are able to colonize or recolonize available habitat as long as a source population is present within a reasonable distance (Swengel, 1981).

Habitat

The KBB inhabits sand savanna and sand barrens habitats, typically black oak sand savanna in northwest Indiana. Larvae are associated with lupine (*Lupinus perennis)* which is the only known host plant for this subspecies.

Canopy cover at most localities is variable, with both open/sunlit and denser and more heavily shaded areas. However, Lane (1994) found that in Minnesota, areas with less than 5 percent woody canopy cover were more likely to have adult butterflies present. At those study sites, open and sunlit areas were more likely to support high densities of nectar plants in flower.

Nectar plants used by adults in Indiana include: *Helianthus divaricatus, Erigeron* sp., *Arabis lyrata*, *Coreopsis lanceolata*, *Phlox pilosa*, *Rubus* sp., *Asclepias tuberosa*, *Asclepias verticillata*, *Ceanothus americanus*, *Euphorbia corrolata*, *Melilotus alba*, *Monarda fistulosa*, *Monarda punctata*, and *Tephrosia virginiana* (Martin, 1994).

The KBB offers an excellent example of the complexity associated with managing for a rare species within a temporally and spatially dynamic ecosystem. For example, in the absence of fire canopy closure, shrub encroachment, and loss of lupine will eventually result in extirpation of a population. Too frequent, too hot, or too extensive burning may result in catastrophic short-term loss of habitat and resulting loss of a population, as happened at Ivanhoe in 1996. Thus, the use of prescribed fire must be carefully balanced to maintain open savanna habitat and lupine presence. Paradoxically, low levels of fire-related larval mortality may be necessary to ensure the longer-term maintenance of suitable habitat.

Several documents also note the importance of utility corridors and rail lines in facilitating KBB movement among metapopulation core and satellite sites (USFWS, 2003a; USFWS, 2006; TNC, 2008). For example, USFWS (2003a) stated that “the remnant habitat along railroad right-of-ways may be critical in linking populations, but it is not currently managed or protected.” Use of rail corridors may put individual butterflies briefly at risk, but without availability of corridors recolonization of unpopulated or extirpated satellite sites may not occur. Recent occurrence within rail corridors has been documented, for example in 1990 along a segment of the Chicago-South Bend South Shore Railroad in Porter County (Martin, 1994).

Rangewide Status

The KBB formerly occurred in a broad band extending from Minnesota to Maine. At present extant populations are known from seven states: Minnesota, Wisconsin, Indiana, Michigan, New York, New Hampshire, and Ohio. The largest clusters of populations are in Wisconsin and Michigan.

Habitat loss, fragmentation, and succession (encroachment of shrubs and closure of tree canopies) are among the threats to the KBB. In the West Gary area, the most serious threats include poor habitat quality and fragmentation (USFWS, 2003).

Martin (1994) surveyed 35 sites in Indiana, including historic localities and areas with potentially suitable habitat. She found KBBs at 10 of those sites, all in Lake and Porter Counties.

Project Area Status

In West Gary, 21 individual tracts within 11 defined preserves were identified as "potentially able to periodically support" KBBs (Shuey, undated; cited in USFWS, 2003).

Through the mid-1990s, KBBs inhabited small portions of Ivanhoe East, where only about 10 to 15 acres of suitable habitat persisted (TNC and USFWS, 2006). At that time Ivanhoe West had little open habitat and did not support the species. There was also a small population at the nearby Toleston Ridges Nature Preserve.

In 1996 two extensive wildfires and a cold, wet spring contributed to the extirpation of the KBB at Ivanhoe and within the West Gary recovery unit (TNC and USFWS, 2006). A few individuals persisted through 1997, but by 1998 the population had been extirpated (P. Labus, TNC, pers. comm.).

In 2001, a reintroduction project was initiated at Ivanhoe but quickly identified a need for additional site management. Extensive restoration work continued, including clearing of shrubs and saplings from the overgrown and mostly shaded sand ridges and application of prescribed fire. This opened up and expanded the available habitat from about 15 acres in the early 1990s to about 80 acres at present (TNC, 2008). Additional KBB releases began in the summer of 2006, using a "gentle release" strategy, with relatively low numbers of butterflies to be released each year for five consecutive years.

KBBs currently inhabit three sites in West Gary: Ivanhoe, Toleston Ridges Nature Preserve, and the DuPont Tract, presumably colonized by animals dispersing from Toleston Ridges. At present most of Ivanhoe East is inhabited, with presence on Ivanhoe West limited to approximately the northern half of the preserve and especially on the northernmost four ridges (P. Labus, TNC, pers. comm.).

Shull (1987) reported observing "dozens" of KBBs on lupine at Hoosier Prairie in June of 1980. He does not give a precise location within the large site, but the only portion of the preserve which is proximate to project-related rail lines will see a substantial decrease in traffic. Martin (1994) did not find the species at Hoosier Prairie during a 1990 survey.

Eastern Prairie Fringed Orchid

Background

On September 28, 1989, the USFWS determined Eastern prairie fringed-orchid (*Platanthera leucophaea* [Nuttall] Lindley) (EPFO) to be a Federally Threatened species under authority of the Endangered Species Act (Act) of 1973, as amended. The USFWS-Great Lakes-Big Rivers Region (Region 3) is charged with oversight for this species. According to the final listing, the species has been extirpated throughout much of its former range by conversion of habitat for crop fields, grazing, intensive and continuous hay mowing, drainage, fire protection activities, and subsequent decline of prairie habitat. At the time of listing, *P. leucophaea* remained extant in approximately 52 populations in seven States and two Canadian Provinces; however, many of these were small, unprotected, and unmanaged populations (USFWS, 1989).

According to the species recovery plan (USFWS, 1999), the EPFO is one of at least 200 North American orchid species, and is limited in distribution primarily by temperature and drought extremes (Correll, 1950). This showy orchid species of North American grasslands is adapted to fire and periodic drought. Its populations are characterized by occasional periods of dormancy or mass flowering. Hawkmoths (*Sphingidae*) pollinate the EPFO at night (Bowles 1983, Sheviak and Bowles 1986, Bowles *et al*. 1992). The EPFO was formerly widespread in prairies and wetlands primarily east of the Mississippi River, while its western species pair, *Platanthera praeclara,* (Sheviak and Bowles 1981) ranged west of the Mississippi.

In September 1999 a recovery plan was completed by the USFWS which delineates reasonable actions needed to recover and/or protect this orchid. The purpose of the plan is to promote the conservation of the threatened EPFO by implementing identified tasks, including protection of habitat, management of habitat, increasing the size and number of populations, conducting surveys of known populations, conducting research, and reviewing progress. The species recovery plan defines a highly viable population as typically having more than 50 flowering plants; a population trend that is stable or increasing over a monitoring period of 5 years; available habitat of at least 50 hectares (125 acres) in size; assurances of ongoing management to reduce impacts from drainage, invasive plant species or woody vegetation encroachment; and protection through long term conservation easements, legal dedication as nature preserves, or other means (Bowles, 1999).

Life History

The EPFO was formerly included within the genus *Habenaria* (Correll, 1950), and is now widely recognized as appropriately belonging to *Platanthera* (Case, 1987). The species is in the Kingdom *Plantae*, Class *Liliopsida*, Order *Orchidales*, and Family *Orchidaceae.*

The EPFO is a perennial herb which regenerates from a fusiform tuber rootstock. This species is characterized by an upright leafy stem and flower cluster (inflorescence) rising 20 to 100 centimeters (cm) (8 to 40 inches) from the underground tuber. Leaves sheath the stem, and are 8 to 20 cm (3 to 8 inches) long, elliptical to lance-shaped, and progressively larger toward the stem base. The single flower spike is usually composed of 5 to 40 creamy white flowers above lance-shaped bracts 1 to 4 cm (less than 2 inches) long. The flowers at the top of the spike open last. The flowers are distinguished by a three-parted fringed lip 1.5 to 3 cm long (less than 1 inch) and a distally thickened nectar spur (tube-like structure) 2 to 5.5 cm long (about 1 to 2 inches) (USFWS, 1999). Leaves and an inflorescence usually emerge in May (if flower primordia were set the prior year), and flowering begins by late June to early July and lasts for approximately 7 to 10 days. Seed capsules mature over the growing season and are dispersed by the wind from late August through September.

The flowers are fragrant after sunset and adapted to pollination by night flying hawkmoths which ingest a high volume nectar resource from long nectar spurs (Bowles 1983). Long term population maintenance requires reproduction from seed, which is accomplished apparently only with pollination by hawkmoths (USFWS, 1999; Pollack, 2005). Reproduction by vegetative spread is apparently rare (USFWS, 1999). Pollination is required for seed production, while seedling establishment depends upon development of mycorrhizae with a favorable soil inhabiting fungi (Bowles, 1983) and

maintenance of graminoid habitat, usually by fire (USFWS, 1999). The EPFO and its western species pair are separated by morphologically different flower structures that prevent hybridization (Sheviak and Bowles 1986). The eastern species places pollen on the proboscis of visiting moths. In contrast, the western species (west of the Mississippi) has larger flowers adapted to placing pollinia (pollen masses) on the compound eyes of visiting pollinators. Increasing pesticide use may impact both pollinators and fungi. A 1998 survey of large sites in Michigan and Ohio identified the following species carrying EPFO pollen: *Eumorpha pandorus*, *Eumorpha achemon*, and *Sphinx eremitus* (D. Cuthrell, Michigan Natural Features Inventory, in litt.1998). Pollination by *S. eremitus* (or *Lintneria eremitus*; Tuttle, 2007) has been confirmed at Illinois sites (Pollack, 2005). Some Illinois records of larval host plants for *Eumorpha pandorus* and *Eumorpha achemon* are *Ampelopsis* spp., and *Vitis* spp.; and for *Sphinx eremitus* are *Monarda* spp., *Mentha* spp., *Lycopsis* spp., and *Salvia* spp. The garden pest tomato and tobacco hornworms have been observed visiting the orchids. A number of additional moth species have been identified as potential pollinators by correlating their proboscis length with the depth to nectar in the EPFO's nectar spur. Surveys have not confirmed their status as pollinators.

The EPFO also has slightly smaller flowers, and often a more elongated and open flower cluster. Two other orchid species may be confused with the EPFO. *Platanthera lacera*, a species of less calcareous habitats, has similar flower color and structure, but has smaller flowers with shorter nectar spurs, ovaries, and flower bracts. *Plathanthera blephariglottis*, a species of acid bogs, has smaller and morphologically different white flowers.

Population Dynamics

Specific requirements for seedling establishment require development of a mycorrhizal association with a favorable soil-inhabiting fungus (Stoutamire 1974). The fungus provides nutrients to the seedling, which may remain underground for several years. Once the seedling emerges from the ground and produces leaves and begins photosynthesis, this relationship may become symbiotic. The root systems of terrestrial orchids are reduced, and require fungal mycorrhizal associations for proper water uptake and nutrition (Sheviak 1990), especially under stress (Hadley and Pegg 1989). Spring burning of prairie stimulates mycorrhizal productivity (Bentivenga and Hetrick 1991), and could be ecologically important in promoting orchid seedling establishment or performance of established orchids. Thus the stability of orchid populations is closely related to the ecological conditions of their mycorrhizae (Sheviak 1974), which may be in part affected by the increased mycorrhizal productivity that occurs after spring burning of prairie (Bentivenga and Hetrick 1991). Disturbance also appears important in EPFO seedling establishment. Although the EPFO is pre-adapted to dormant season disturbances, such as prairie fires, growing season damage to vegetative material may weaken plants by limiting food storage. Mowing or cropping of plants early in the growing season may also result in failure to form the next season's flower bud, inducing dormancy or even death the following season (Sheviak 1990).

Under some conditions, the EPFO can be extremely long-lived. Case (1987) reported plants surviving up to 30 years in gardens, and small populations have persisted in cemetery prairies where annual mowing prevented seed production for decades (Bowles *et al*. 1992). However, dramatic fluctuations

in plant numbers may occur in natural populations, with flowering correlated positively with rainfall and negatively with temperature cycles, as evidenced by data from an Illinois wet prairie (Bowles *et al.* 1992).

In habitats with large scale disturbance patterns, EPFO populations shift spatially over time, with high population turnover, decline, or total loss (Bowles 1983, Case and Case 1990). Continual recolonization of successional habitats is dependent on massive seed production and dispersal, which requires high pollinator visitation rates and presence of appropriate soil fungi. The most remarkable natural population fluctuations of the EPFO have occurred in relation to cyclic Lake Huron and Lake Erie shoreline fluctuations and water level fluctuations caused by human management (Case 1987, Case and Case 1990, Watson 1998). Ohio populations around Lake Erie have reached the highest flowering population counts at intermediate lake levels, suggesting that there may be an optimal level that promotes flowering (Windus and Cochrane 1997). Orchids apparently colonize early-successional habitat 2 to 5 years after lake flooding or diking. After about 5 years, flowering orchids appear, but may gradually decline with invasion by dogwood (*Cornus* sp.) on mesic sites, and by purple loosestrife or reed canary grass (*Phalaris arundinacea*) on wet sites. Maintenance of a series of advancing successional stages may ensure that suitable sites are available for prairie orchid colonization as water levels fluctuate. Managers of sites with artificially controlled water levels should ensure that orchid populations remain undisturbed for at least 5 years, allowing time for seed production and dispersal to other suitable areas within the site (USFWS 1999).

Habitat

The EPFO requires full sun for optimum growth and reproduction and a grassy habitat with little or no woody encroachment. It occurs in habitats ranging from mesic prairie such as tallgrass, calcareous silt-loams, or sub irrigated sand prairies, to wetlands such as sedge meadows, fens, occasionally sphagnum bogs, marsh edges, and other groundwater maintained habitats (Bowles 1983). The substrate of the sites where it occurs ranges from more or less neutral to mildly calcareous (Case 1987, Sheviak 1974, Bowles 1983). It appears to be adapted to natural patch disturbances, or areas with dynamic disturbance regimes; occasionally the orchid colonizes successional habitats or recolonizes previously occupied areas (Bowles 1999). According to the 1999 recovery plan, the tubers are dormant during winter and thus are adapted to dormant season prairie fires; such fires and high precipitation levels appear to promote flowering (Sheviak 1974; Roosa and Eilers 1979; Bowles 1983; Currier 1984). Blossoms often rise just above the height of the surrounding grasses and sedges. The more exposed flower clusters are more likely to be visited by the hawkmoth pollinators, though they are also at greater risk of being eaten by deer. A symbiotic relationship between the seed and soil fungi (mycorrhizae) is necessary for seedlings to become established. The fungi helps the seeds assimilate nutrients in the soil.

Potential habitats occur across various six physiographic regions, including the lake plains of the Lake Michigan, Lake Huron, and Lake Erie basins that support prairie habitat. Disjunct populations also occur in unglaciated sedge meadow, and formerly were documented to occur in unglaciated prairie in Oklahoma. The EPFO can occupy a broad moisture gradient. In sand prairies, this gradient ranges from mesic prairie along the tops of low dune ridges to wet prairie in shallow interdunal

swales (Bowles 1985). Sand prairies are occupied in areas with adequate calcareous groundwater supplies, primarily in the lake plains of the Great Lakes. Most midwestern EPFO populations occur in silt-loam soils derived from loess or glacial till. Loess deposits over glacial till or outwash predominate in Illinois, but become thin or absent northward in Wisconsin. In silt-loam soils, most populations are found in level mesic prairie or in wet prairie along the borders of prairie potholes and watercourses; but the orchid occasionally occurs in upland sites, such as along ridges created by glacial deposits (Bowles *et al*. 1992).

Rangewide Status

The EPFO historically occurred primarily east of the Mississippi River with a distribution pattern extending from Oklahoma north to Manitoba and east in a narrowing peninsula through the Great Lakes states to Maine. It historically was documented to occur in 13 US states and one Canadian province (COSEWIC 2003).

At the time of Federal Listing in 1989, *Platanthera leucophaea* distribution was reported to have declined over 70 percent from original records with approximately 52 extant populations reported in seven states. The final rule states, "Primarily due to the destruction of large grasslands east of the Mississippi River, extremely large or extensive populations of this orchid do not exist in the United States" (USFWS 1989). Early decline appears due to conversion of natural habitats to cropland and pasture. At the time of US Federal listing, states in which the EPFO was known to occur included Illinois, Iowa, Maine, Michigan, Ohio, Virginia, and Wisconsin. In Canada, 20 populations were documented in fens and prairie habitats in 12 Ontario counties; and one fen population was estimated at 2,000 plants (COSEWIC 2003).

At the time of preparation of the recovery plan in 1999, *Platanthera leucophaea* was reported to persist in 59 populations in 6 states, most populations being in Wisconsin, Illinois, Michigan, and Ohio. Only 15 of these extant populations in the United States had full legal protection. Six U.S. populations were considered to have high viability with potential for long term persistence, four of which had full legal protection (Bowles 1999).

Most remaining habitats are small, with fewer than 50 plants, and are not representative of the once vast prairie populations of this orchid (Sheviak 1974, Bowles 1983, Case 1987). Only a few population census counts in the US have exceeded 500 flowering plants, and these numbers are from successional habitats that fluctuate widely over time (USFWS 1999). Currently, known populations appear to be consistent with those historically reported in the 1999 recovery plan. Current population decline appears mainly due to the loss of habitat from the drainage and development of wetlands. Other reasons for the current decline include succession to woody vegetation, competition from non-native species and over-collection. A decline in the species-specific pollinator from pesticides and loss of habitats also likely affects the regeneration capabilities of the orchid.

Project Area Status

According to the 1999 recovery plan, Illinois may have contained the largest and most extensive pre-European settlement populations of the EPFO, and has sustained the most drastic decline in

populations out of any state. Originally the species was known from tallgrass prairie in 33 Illinois counties across the northern two thirds of the state, an area now almost totally converted to agriculture (Sheviak 1974, Bowles and Kurz 1981). As many as 20 populations may occur in six counties concentrated in the Chicago region, and single populations occur in cemetery prairies in eastern and west-central Illinois counties (Bowles *et al*. 1992). Though 14 Illinois populations are protected and managed, only two of these contain more than 100 plants. This orchid was successfully introduced by seed broadcast into three sites in Cook County, Illinois (Packard 1991). Based on the success of these introductions, seeds produced by hand pollination have been introduced into 14 additional northeastern Illinois sites and one Wisconsin site (Keibler *et al.* 1993; Keibler 1994, 1995, 1998).

Within the project-specific vicinity, there is one documented population in DuPage County. The population is approximately 1,200 feet west of an existing EJ&E train line, and no construction activities are currently planned within the general vicinity of this location.

EPFO populations in Lake and DuPage Counties, Illinois were examined as reference sites on October 27, 2008, and were located at the wet prairie/mesic prairie interface. *Calamagrostis canadensis* was common at both sites. On October 29, 30 and November 6, surveys were conducted along the EJ&E line to identify areas of potentially suitable habitat. Several small wet prairie remnants were identified, all of them small and of low to moderate quality. Survey results are included in Appendix B.

Leafy Prairie Clover

Background

Leafy prairie-clover (*Dalea foliosa* [Gray] Barneby) is a short-lived herbaceous perennial in the Legume family (*Fabaceae*). The species was first described as *Petalostemum foliosum* by Asa Gray in 1868 (USFWS 1996) and is considered one of America's rarest plants (Swink and Wilhelm 1994). *Dalea foliosa* grows in open, rocky habitats such as glades and dolomite prairies.

Individual plants grow from a central root crown at or just below the surface and may have one to as many as 20 stems, ranging from 2 to 8 decimeters tall. Stems are smooth and leaves are alternate and oddly, pinnately, compound. Flowers are clustered in dense, cylindric heads up to 8.9 centimeters long. Individual flowers have a lavender-purple calyx up to 5 millimeters long, with five petals and five exerted anthers.

Life History

Leafy prairie clover shoots develop in early spring from buds generated at the base of the previous year's growth (Baskin and Baskin 1973). Plants do not flower until their second or third year or later (Baskin and Baskin 1989). Mature plants may not flower every year; may have diminished vegetative growth; or may go dormant for years (USFWS 1996).

Flowering adults may have one or many stems with multiple flower spikes (Baskin and Baskin 1989; USFWS 1996). Flowering begins in July and continues through early September (Swink 1994; USFWS 1996). Yearly seed production is typically high (Baskin and Baskin 1973). In a 1990 study

of Illinois populations, seed set was greater than 70 percent (USFWS 1996). Seeds ripen by October, but may remain on the old flower stalks through early spring.

Leafy prairie clover does not spread vegetatively, but reproduces from yearly seed production and a persistent seed bank (Baskin and Baskin 1973; USFWS 1996). Seeds overwinter and may remain dormant for several years. Germination occurs in April and by late May; seedlings have several leaves (Baskin and Baskin 1973). Seedling mortality is high and the life span of most mature plants is less than 8 years (USFWS 1996).

Population Dynamics

A rangewide 1992 census of all leafy prairie clover populations created arbitrary categories of population size and age structure in order to compare populations in Illinois, Tennessee, and Alabama. Populations were classed as small (<100 plants), moderate (=/>100 but <500 plants), or large (500+). Plants were classified by reproductive/growth stages into: Flowering plants; Non-flowering plants (=/>10cm tall); and Seedlings (single stem <10cm tall) (USFWS 1996).

In moderate and large populations, flowering plants ranged from 11.6 to nearly 53 percent of all plants, non-flowering plants ranged from 34.5 to 43.7 percent, and seedlings ranged from 3.4 to nearly 53 percent (USFWS 1996). Small populations are more variable in structure; the entire population may consist of a few persistent mature plants or non-flowering plants, or entirely of immature plants. In small populations, seedlings make up a smaller percentage than in moderate and large populations. Surveys of Illinois populations since 1990 have found that patches occasionally go dormant or disappear altogether, and may reappear years later (USFWS 1996).

Habitat

Leafy prairie clover is found in open habitats with thin soils over flat, often fractured, limestone bedrock (USFWS 1996). References to the habitat of *Dalea foliosa* compiled from historic sources by Baskin and Baskin (1973) include a variety of habitats on rocky substrates such as “river banks,” “rocky hills,” “gravelly soil,” “cedar glades,” and “barrens.” In Illinois, *D. foliosa* populations are found in “shallow-soil prairies where dolomitic bedrock is near the surface” (Swink and Wilhelm 1994).

In the project area, the Keepataw population occurs in a small remnant dolomite prairie. This community was once found along much of the Des Plaines River Valley, before the extensive quarrying and industrial activities of the last 150 years. Taft (1989) described the Keepataw site as wet-mesic to mesic dolomite prairie and sedge meadow. He listed the following species as dominants in this habitat: *Schizachyrium scoparium, Deschampsia caespitosa, Liatris pycnostachya, Pycnanthemem virginicum, Carex spartwellii, Carex stricta, Calamagrostis canadensis, Glyceria striata, Juncus dudleyii,* and *Lythrum alatum.*

Rangewide Status

Leafy prairie clover was listed as endangered by the USFWS on May 31, 1991; previously, it had been listed as endangered in Tennessee (1989) and Illinois (1990). Leafy prairie clover is narrowly

restricted to cedar glades, barrens, and dolomite prairies in these states. Habitat destruction and degradation has reduced historic population levels by over 45 percent and continues to threaten current sites.

The USFWS *Recovery Plan for the Leafy Prairie-clover* (USFWS 1996) lists 31 known populations: two in Alabama; three in Illinois; and 29 in Tennessee. Since the publication of the Recovery Plan, two other Illinois populations have been discovered. Currently, all naturally- occurring Illinois populations are found in Will County. Four of these sites are within the Des Plaines River Valley: Keepataw Forest Preserve, Romeoville Prairie, Lockport Prairie Nature Preserve, and a newly-discovered population on private land east of the river in Romeoville. The fifth Will County population was discovered in 1998 at the Midewin National Tallgrass Prairie. In 1996, another population was discovered at the Jarrett Prairie in Ogle County, but it is suspected that this population is an escape from cultivation at the nature center (Bowles *et al* 1999).

A range-wide census of leafy prairie clover populations, done in 1992, tallied over 10,000 plants (USFWS 1996). Most populations are small (<100 plants) or moderate (>100 but <500 plants) in size. Several Tennessee populations have over 1000 plants and a large population, estimated at over 5000 plants, is found in the Lockport Prairie Nature Preserve in Illinois (USFWS 1996).

In Illinois, leafy prairie clover has been successfully introduced into three prairie restorations: a wet-mesic prairie at the College of DuPage in Glen Ellyn, Illinois; a recreated gravel and dolomite prairie at the Morton Arboretum in Lisle, Illinois; and a dry-mesic gravel prairie restoration in Waterfall Glen Forest Preserve in DuPage County, Illinois (USFWS 1996).

Project Area Status

Leafy prairie clover is known to occur at Lockport Prairie Nature Preserve, at Lockport East Preserve, and at the Hanson Material Service Long Run/Com Ed Parcel (slightly more than 200 meters from the CN Joliet Subdivision line.

ENVIRONMENTAL BASELINE

Environmental Baseline

Inventories and Surveys

A series of habitat-level surveys were conducted to characterize existing conditions within the Action Area. Initial surveys were completed in the early spring of 2008, followed by more focused surveys emphasizing HED and EPFO habitat in October and early November 2008. These latter visits are summarized below.

Illinois sites in the lower Des Plaines River Valley, including two segments of the Paul Ales Branch line, the proposed Joliet connection, and Dellwood Park West were investigated for potential HED habitat on October 18th, 2008.

Indiana sites including Kirk Yard and the proposed Griffith and Ivanhoe connections were visited on October 29th, 2008. Representatives of HDR, Winzler & Kelly, CN, EJ&E, USFWS, IN DNR, and TNC were present.

A subsequent hi-rail survey was carried out by representatives of HDR and Winzler & Kelly on October 30th, 2008, with CN and EJ&E representatives present. All areas of proposed Illinois double-track or connection construction were examined, except for the proposed Matteson connection. A subsequent visit was made to areas of remnant natural habitat and the Matteson connection on November 6, 2008, by HDR and USFWS, with CN and EJ&E representatives.

The following description is based on these site visits, supplemented by earlier field visits and published information.

Existing Environmental Conditions

Most of the immediate rail corridor is heavily disturbed, and dominated by weedy or ruderal vegetation. Extensive areas are overgrown with shrubs and saplings, with the understory shaded and nearly barren. Other areas are covered by weedy herbaceous vegetation. Excavated drainage ditches are common. In many areas residential lawns, agricultural fields, or paved and developed areas are present in immediate proximity to the rail line. Even where the rail line passes through public open space, the area immediately adjacent to the rail line tends to be heavily disturbed. Within preserves, areas more distant from the tracks support a range of natural and disturbed communities, including areas currently under restoration.

Better quality natural communities are extremely limited in extent within the railroad ROW where construction activities are proposed. The few wet to mesic prairie remnants identified are summarized below; more detailed information is included in Attachment B.

Lake County, Illinois: a small mesic prairie remnant was identified near Mundelein, and extended for several hundred feet. The remnant was on the opposite (north) side of the tracks from the proposed new double-track, and will not be disturbed. The work area included dense shrub cover and a near-barren substrate within what appeared to be an excavated ditch.

DuPage County, Illinois: Proposed Munger Connection. This area is dominated by reed canary grass and cattails, but includes several small openings of remnant wet prairie and sedge meadow vegetation. The largest opening measured approximately 8 by 15 meters, and other openings were considerably smaller.

Normantown: near 91st Street, a wet prairie dominated by bluejoint grass parallels the east side of the rail line for several hundred feet. The prairie occupies a narrow (25-30 feet) wide corridor between the railroad and a parallel segment of Normantown Road. A second, smaller wet prairie remnant was observed a short distance to the south.

Gougar Road: A small wet prairie is present in a shallow ditch adjacent to the rail line.

Schoolhouse Road: A wet prairie remnant of small to moderate size is present north of the rail line, which is on an elevated embankment at this location.

Lake County, Indiana: Several high quality natural areas including Ivanhoe Nature Preserve and Lakeshore Railroad Prairie are in close proximity to the Action Area, although the immediate rail

corridor is generally disturbed. Site visits with USFWS, INDNR, and TNC to areas of proposed construction did not identify any habitat for Federally listed species immediately adjacent to the rail lines.

EFFECTS OF THE ACTION

Direct Effects

Indiana Bat

There will be no direct effects on the Indiana bat, which is not known to occur within the Action Area. The nearest documented locality is approximately 17 km east of the EJ&E line crossing of the Little Calumet River.

Hine's Emerald Dragonfly

There will be no direct effects of the Action on the HED, for the reasons documented below for each of four rail segments.

No increase in operations or construction activity is proposed on the Paul Ales Branch line as a result of the Transaction, which passes in close proximity to high-quality HED habitat. Thus there would be no affect. The Final EIS will be revised to reflect that speed restrictions on the Paul Ales Line are a result of the special conditions of the 1996 U.S. Army Corps of Engineers (COE) permit (Permit # 199600211) issued to Commonwealth Edison. SEA has included this as a condition within mitigation in Chapter 4 of the Final EIS.

There would be no construction related effects from the proposed Joliet connection, which runs for a short distance through unsuitable HED habitat. Most of the area consists of dense buckthorn and other invasive shrubs and saplings. No HED observations have been made in the interior of dense shrub habitat in 14 years of monitoring at other Illinois sites (Mierzwa, 1995; Mierzwa, 2008a). There is a narrow herbaceous opening and a crossing of a small stream in the northern half of the connection, however the stream is larger than known HED breeding sites (more than a meter in width), and stagnant. The stream provides good habitat for common dragonflies such as Libellulids, and competitive interactions with these species would preclude use by HED. Fish (cyprinid minnows, many of which are insectivores) were observed in the stream during an October 2008 site visit, providing additional support to the non-habitat determination.

There would be an increase in traffic on EJ&E segment 9B, from 18.5 to 42.3 trains per day. However, train speed would not exceed 10 mph in these areas because of track and bridge constraints. Observations on the nearby Paul Ales Branch line have indicated that HED have no difficulty evading slow-moving trains. Mierzwa (unpublished observations) watched HED forage over slow-moving trains, even darting between cars without difficulty. Fast moving trains (or other vehicles) could potentially cause dragonfly mortality, but in the areas identified above higher speeds are either prohibited or precluded by infrastructure constraints.

Discussions with the Applicant indicate that contrary to information included in the Draft EIS, there will be no increase in train traffic on CN's Joliet Subdivision line. Operations are currently at 2.0

trains per day, plus 10 Amtrak trains per day and 4.3 Metra trains (3 trains Monday through Friday in each direction) using the same lines, and will remain at identical levels (Cunningham 2008). A HED breeding population at Long Run Seep Nature Preserve and a probable breeding population at the Long Run/Com Ed Parcel occur in proximity to the Joliet Subdivision, and there are isolated records away from the tracks of what are assumed to be dispersing individual dragonflies to the south at Lockport East and Dellwood West. CN has conducted preliminary studies on the interactions of dragonflies and the relatively fast moving trains on the Joliet Subdivision and plans to continue these studies. Preliminary surveys of this segment of the CN line did not note dragonfly mortality, but the findings were based on only six days of field effort (AECOM 2008).

HED larval presence is assumed but not confirmed within an extensive sedge meadow complex immediately west of the Joliet Subdivision tracks at the Long Run/Com Ed Parcel. Adult territorial observations are common in areas 50 to 150 meters east of the tracks, as many as three in one morning; (Mierzwa 2008b). There are no well-defined rivulets at this location and a near absence of visible flow, the inner track is inactive, and there is no evidence of settling along the tracks. Because there is no proposed change in operations at this location, there will be no new adverse impacts to adults or larvae.

Karner Blue Butterfly

There would be no direct effect on the KBB. No potential habitat was noted in the immediate vicinity of the proposed Ivanhoe or Griffith connections, and the documented presence of the species is within the Ivanhoe preserve, not along the sparsely vegetated rail corridor.

Eastern Prairie Fringed Orchid

There would be no direct effect on the EPFO, based on the currently available information. Habitat surveys were conducted on October 28, 30, and November 6 within the Action Area, and a few areas of remnant wet prairie were identified which are unlikely to support EPFOs because of small size (less than one acre, usually much less), relative isolation from other/larger natural areas, and relatively degraded condition (FQI less than 20, and usually less than 10). Preconstruction surveys will be conducted in the growing season and prior to any project-related disturbance to verify that the species is not present.

Leafy Prairie Clover

There would be no project-related effects on leafy prairie clover, because populations are more than 200 meters from the nearest active rail line, and because there would be no increase in operations in proximity to these populations.

Indirect Effects

On October 23, 2008, Midwest Generation informed USFWS that the proposed acquisition of EJ&E would result in the loss of coal train storage areas serving their Will County facility, and would have required Midwest Generation to “increase the number of rail sidings/lines within the River South area.” This would result in impacts to known HED breeding and foraging habitat.

After detailed review of the Midwest Generation proposal and discussions with Midwest Generation, USFWS, SEA and CN; it has been determined that there is no cause and effect relationship between the CN acquisition of EJ&E and the construction of additional rail sidings at River South. Midwest Generation has indicated that the construction of additional rail sidings at River South is not its preferred alternative to solve its coal storage capacity issues. CN has committed to a voluntary mitigation measure which would result in discussions with Midwest Generation to identify reasonable alternative locations for coal train storage. The analysis and the CN discussion of alternatives are included in Attachment D.

Interdependent and Interrelated Actions

No interdependent or interrelated actions have been identified

Cumulative effects

A HCP has been proposed for the HED in the lower Des Plaines River Valley (IDNR 2005). The HCP has not yet been published, and the specific proposals of the various participants are not at this time public knowledge. It is reasonable to assume that the HCP would permit impacts to HED habitat, and that provisions of the HCP would also result in beneficial effects in the form of habitat restoration or enhancement, some of it likely to occur within the Action Area. Details are not currently known.

No other reasonably foreseeable cumulative impacts have been identified at this time.

FINDINGS

The proposed activity **may affect, but is not likely to adversely affect, the Indiana bat.** A population is known from the floodplain of the East Branch Little Calumet River in Porter County, 17 kilometers east of the EJ&E line crossing. No construction is proposed in this area.

The proposed activity **may affect, but is not likely to adversely affect, the Hine's emerald dragonfly**. There will be no direct construction-related impacts to adults or larvae. Increases in daily operations on EJ&E Segment 9B including the Des Plaines River Bridge and on the proposed Joliet Connection will be subject to 10 mph speed limitations which, based on past observations at nearby sites (Mierzwa, unpublished data), will avoid risk of adverse train-HED interactions. The number of daily operations on the Joliet Subdivision will not change.

The proposed activity is **not likely to adversely affect Hine's emerald dragonfly critical habitat**. There is no new construction proposed as part of the project within the area designated as critical habitat.

The proposed activity **may affect, but is not likely to adversely affect, the Karner blue butterfly**. Populations occur near EJ&E rail lines at Ivanhoe and at the DuPont Tract, but there is no evidence that populations occur in immediate proximity to or utilize the rail corridor at this time.

Based on currently available information, the proposed activity **may affect, but is not likely to adversely affect, the Eastern prairie fringed orchid**. The only known extant population in the

Action Area is approximately 1,200 feet from the active rail line. No construction will occur at this location, although there will be a substantial increase in daily rail operations. Habitat surveys in October and November 2008 identified five small areas of remnant native wet prairie and related communities. The Applicants have committed to conduct preconstruction habitat and species surveys, and if a currently unknown population is discovered, USFWS will be notified immediately and consultation will be re-initiated.

The proposed activity **may affect, but is not likely to adversely affect leafy prairie clover**. Populations occur slightly over 200 meters from the Joliet Subdivision and Paul Ales Branch line, but there would be no construction and no increase in operations in the vicinity of these populations.

MITIGATION MEASURES

The Applicants committed to voluntary mitigation (VM) measures for effects on biological resources. The Applicants offered additional measures in response to SEA's recommendations in the Draft EIS. SEA recommends that compliance with the voluntary mitigation be made a condition of any approval of the Transaction.

Based on comments received on the Draft EIS, SEA has recommended conditions to enhance several VM's. SEA also re-analyzed the Applicants' voluntary mitigation measures developed to mitigate the potential effects of the Proposed Action on biological resources in response to Draft EIS comments received on biological resources either during the formal Draft EIS comment period or at SEA's public meetings. As a result, SEA recommended mitigation measures to supplement the voluntary mitigation measures to which the Applicants have committed.

Voluntary measures and SEA conditions related to endangered species are listed below. Several are specifically related to Federally threatened or endangered species.

CN VM In accordance with their Emergency Response Plan, Applicants shall make the required notifications to the appropriate Federal and state environmental agencies in the event of a reportable hazardous materials release. Applicants shall work with the appropriate agencies such as the United States Fish and Wildlife Service, Illinois Environmental Protection Agency and Indiana Department of Environmental Management to respond to and remediate hazardous materials releases with the potential to affect wetlands or wildlife habitat(s), particularly those of Federally threatened or endangered species.

CN VM Before beginning construction activity, Applicants shall survey all suitable habitats potentially impacted by the construction activity for Federally- and state-listed threatened or endangered plant species. If any listed plant species are located, Applicants shall implement a mitigation plan in consultation with the appropriate Federal and state agencies.

CN VM If identified in the area, Applicants shall coordinate with USFWS-Indiana and The Nature Conservancy (TNC) to monitor effects on the Karner blue butterfly in the West Gary Recovery Unit.

CN VM Applicants shall continue with the existing agreements for Paul Ales Branch operation for the protection of the Federally-listed Hine's emerald dragonfly.

CN VM For impacts to non-jurisdictional isolated wetlands habitat along the new line, Applicants shall survey the route to determine if the Hine's emerald dragonfly is present along the ROW.

CN VM Upon consultation with USFWS, should the Hine's emerald dragonfly be observed on the site of Transaction-related construction activities, Applicants shall implement appropriate measures prior to and during construction to reduce or eliminate impacts on the Hine's emerald dragonfly.

CN VM Applicants shall cooperate with Midwest Generation, LLC ("MWG"), to identify locations on Applicants' property, or available to Applicants, on which loaded coal trains could be staged while awaiting delivery to MWG's Will County Generating Station and Joliet Generating Station and which would make unnecessary the construction of additional train storage capacity on MWG property that would adversely affect the Hine's emerald dragonfly or its habitat. If no adequate existing train storage locations can be identified, Applicants shall make reasonable efforts to acquire or construct, at MWG's expense, new train storage capacity, at locations where construction would not have adverse impacts on the Hine's emerald dragonfly or its habitat, and which would make construction of additional storage capacity on MWG's property unnecessary, and shall make that capacity available as needed for staging of coal trains destined for Will County and Joliet Stations.

CN VM In consultation with the U.S. Fish and Wildlife Service (USFWS) and relevant natural resource stakeholders, Applicants shall participate in the development of a Habitat Conservation Plan for the Hine's emerald dragonfly or necessary work plans applicable to State and Federally listed threatened and endangered species and take the necessary measures to ensure that rail operations do not cause undue impact to those species.

CN VM [Karner Blue Butterfly] In consultation with USFWS, Applicants shall identify areas of suitable habitat of the Karner blue butterfly within Kirk Yard and in the vicinity of all planned Transaction-related construction of double-track and new or improved connections within the State of Indiana for potential habitat protection and/or enhancement. Applicants shall contact TNC about participation in the Safe Harbor Agreement for the Karner blue butterfly.

CN VM [Indiana Dune and Swale] In consultation with appropriate Federal and State natural resource stakeholders, including USFWS, INDNR and TNC, Applicants shall designate EJ&EW-owned areas of prime prairie and dune swale habitat for potential land management agreement and/or conservation easement. Should modifications to Kirk Yard be proposed in the future, Applicants shall review proposed plans for upgrading and expansion of Kirk Yard in order to avoid construction in identified dune swale areas. In the event that unavoidable impacts are identified, the Applicants shall work with TNC to develop a plan for mitigation of those impacts and improvement of the quality of remaining dune swale areas.

CN VM [Eastern prairie fringed orchid] Prior to any ground disturbing activities, Applicants shall hire a qualified biologist to survey for the Eastern prairie fringed orchid (*Platanthera leucophaea*) in areas containing suitable habitat. Applicants shall survey each area on at least three non-consecutive days between June 28 and July 11, as this is when the orchid typically flowers and is most identifiable. If the Applicants' biologist finds orchids, Applicants shall not conduct any construction activities in that area and Applicants shall notify USFWS and the Board immediately. The Board shall reinitiate consultation with USFWS. Applicants shall work with the Board and USFWS to determine appropriate measures to offset impacts, most likely providing funding for an ongoing hand pollination project, or providing funding to be used to enhance another orchid site (that is, brush cutting, prescribed burning).

CN VM During construction, temporary barricades, fencing, and/or flagging shall be used in sensitive habitats to contain construction-related impacts to the area within the construction Right Of Way ("ROW"). Staging areas shall be located in previously disturbed sites and not in sensitive habitat areas.

SEA Applicants shall establish a local resource agency liaison(s) with expertise in environmental and natural resource management to work closely with Federal, state, and local natural and water resource agencies (including Fermilab) for the purpose of improved adaptive natural resource management. Applicants shall name their liaison(s) within 1 month of the effective date of the Board's final decision. Applicants' liaison(s) shall ensure that the adaptive management measures developed shall be incorporated into all relevant railroad ROW maintenance contracts. Applicants' liaison(s) shall be available to consult with resource agencies for a minimum of 5 years following the effective date of the Board's final decision.

SEA Applicants shall work with relevant natural resource stakeholder groups, forest preserve districts, TNC, INDNR, IDNR, and USFWS to establish appropriate monitoring programs. These programs include identifying baseline conditions and post-transaction conditions, in areas adjacent to forest preserves and designated natural areas on species of concern to the above groups. The Applicants shall fund the monitoring programs beginning within 1 year of the effective date of the Board's final decision and for a period of 4 years thereafter.

SEA Applicants shall continue to abide by the special conditions of the 1996 USACE Permit #19960211 for train operations on the Paul Ales Branch in order to minimize further effects on Hine's emerald dragonflies.

SEA To avoid any direct take of Indiana bats, the Applicants shall not remove trees within the former EJ&E ROW with a diameter of 3 or more inches between April 15 and September 15. The Applicants shall avoid or minimize tree clearing and snag removal within project-related construction area limits. In the railroad ROW (former EJ&E), outside the clear zone and considering other safety factors, the Applicants shall minimize tree clearing to maintain woods in a natural state, to the extent practicable.

SEA Applicants shall immediately cease transaction-related construction in the event that a previously unidentified Federally- or state-listed threatened or endangered species is encountered during construction activities. In that event, the Applicants shall consult with USFWS for Federally-listed species and IDNR and/or INDNR for state-listed species for guidance on how to minimize transaction-related effects and protect these species, and shall comply with the reasonable solutions suggested by those agencies. The Applicants' resource agency liaison(s) shall serve as coordinator(s).

SEA Prior to transaction-related construction activities, the Applicants shall reexamine the Federal and state lists of threatened and endangered species for any newly listed species and shall consult with the appropriate resource agencies on any newly listed species. The Applicants' resource agency liaison(s) shall serve as coordinator(s).

Analysis of Alternate Actions

SEA evaluated three alternatives: No-Action, the Proposed Action, and the Proposed Action with conditions, including environmental mitigation measures. SEA initially considered another four alternatives (discussed in Section 1.6.4 of the DEIS, Alternatives Eliminated from Detailed Analysis), but eliminated them from detailed study.

The Proposed Action is described in detail in the project description section of this document. To reach its decision, the Board will consider the Draft and Final EIS, including SEA's final recommended mitigation, the comments received on the Draft EIS, and other environmental information provided by interested parties. If the application is approved, the Board will identify what, if any, mitigation measures, including environmental mitigation, should be imposed as conditions.

No-Action Alternative

CEQ's regulations implementing NEPA (40 CFR 1502.14(d)) require consideration of a No-Action Alternative. The No-Action Alternative provides a basis for understanding the impacts of the Proposed Action. Under the No-Action Alternative, the Applicants would not acquire control of the EJ&E land, rail line, and related assets; SEA assessed rail operations on the EJ&E rail line at existing levels. The Applicants would continue to make connecting train movements through the Chicago Terminal District in the same way as these movements now occur, would not construct the six connections or the double-track, and would not make changes to existing yard operations.

Alternatives Eliminated from Detailed Analysis

SEA considered four additional alternatives, but found them to be unreasonable and infeasible because they would not meet the Applicants' purpose of, and need for, the Proposed Action. These alternatives were: 1) expanded trackage rights to CN; 2) implementation of the Chicago Region Environmental and Transportation Efficiency (CREATE) Program in lieu of CN's acquisition of the EJ&E rail line; 3) acquisition of a different rail line within the Chicago metropolitan area; and 4) construction of a bypass outside of the EJ&E rail line in Northern Illinois. In general, SEA found

these alternatives to be unreasonable because they would not give CN full ownership and use of a continuous rail route around Chicago, or the Applicant's could not gain access to EJ&E rail yards.

CONCLUSION

This biological report evaluates Federally listed species known to occur at present or historically in the greater Chicago region. Four species were eliminated from further consideration because they do not presently occur in proximity to the Action Area, or because they occur only in areas where no construction or operational impacts are reasonably anticipated. Five species (Indiana bat, Hine's emerald dragonfly, Karner blue butterfly, Eastern prairie fringed orchid, and leafy prairie clover) were evaluated because preliminary information indicated that they do occur or might occur in or near the Action Area. After a detailed review of available information and habitat-level field surveys, determinations of "may affect but not likely to adversely affect" were made for all five species. For one species, the EPFO, the Applicant has agreed to conduct pre-construction surveys and to re-initiate consultation if the species is found within an area of proposed activity. Several mitigation measures have been proposed by the Applicant and by SEA, some of which are expected to benefit listed species or protect or manage habitat.

Canadian National Railway Company and Grand Trunk Corporation—Control—EJ&E West Company.

GLOSSARY

Action Area	Under the Federal Endangered Species Act, the area potentially subject to direct or indirect project-related impacts.
Anthers	The part of a flower which contains pollen.
Barrens	A sparsely vegetated natural community, with few trees or widely scattered trees; often, with exposed bedrock or very shallow soils
Bivoltine	Two generations per year.
Buckthorn	A weedy shrub or small tree, originally Eurasian, introduced to the U.S. as an ornamental probably in the 1850s. It tends to form solid stands and shade out native species.
Calcar	A spur-like projection on the leg of a bat.
Calcareous	With a high proportion of calcium carbonate; alkaline, with a relatively high pH. In the Chicago region, usually referring to soils associated with limestone or dolomite bedrock.
Calyx	A part of a flower, lying underneath the more conspicuous petals.
Cohorts	A group of individuals experiencing events within the same timeframe.
Conservation easement	A legal restriction on land use; usually used to ensure that land is maintained as open space. Usually the landowner accepts a cash payment or receives a lower tax rate in return for giving up development rights.
Critical habitat	A designation under the Federal Endangered Species Act, defined as (1) specific areas within the geographical area occupied by the species at the time of listing, if they contain physical or biological features essential to conservation, and those features may require special management considerations or protection; and (2) specific areas outside the geographical area occupied by the species but essential for conservation. All Federal agencies must ensure that any actions they authorize, fund, or carry out are not likely to jeopardize the continued existence of a listed species, or destroy or adversely modify its designated critical habitat.
Cyprinid	A type of minnow, or small fish; referring to a large and widely distributed family of species.
Density	Number of individual animals per unit of area; for example “six dragonflies per acre” is a measure of density.
Detritus	Accumulated organic material, in this context found on the bottom of aquatic habitat.
Disjunct	Separate from, isolated.
Distally	Remote, farther from a point of reference.
Dolomite	A type of rock composed of calcium magnesium carbonate. Similar to limestone but with the presence of magnesium. The dominant underlying bedrock of the Chicago region.
Dolomite prairie	A grassland community on thin soils over dolomite bedrock. Variants ranging from wet to dry have been described.
Dormancy	A period when growth, development, and (in animals) physical activity is suspended.
Elliptical	Generally, an elongated oval.

Exfoliating bark	Loose bark on a living or dead tree, with a gap or space beneath. Often the condition is temporary, with the bark falling away after months to years.
Extant	Still in existence, not extinct.
Extirpated	Local extinction, as when a species ceases to exist at a given location but still exists elsewhere. Loss of a population.
Fecundity	The ability to reproduce; reproductive potential.
Fen	A type of wetland fed by alkaline groundwater.
Formal consultation	Under Section 7 of the Federal Endangered Species Act, a process for Federal Agencies to determine to effects of an action on one or more protected species, resulting in the issuance by U.S. Fish and Wildlife Service or National Marine Fisheries Service of a biological opinion.
Fusiform	A spindle-like shape, wider in the middle and tapered at both ends.
Glades	Open communities with sparse vegetation on exposed bedrock or very thin soils.
Graminoid	Dominated by grasses.
Habitat Conservation Plan	Under Section 10 of the Federal Endangered Species Act, a mechanism to authorize "take" of a protected species in return for habitat preservation, habitat management, or some other set of actions intended to help conserve the species.
Habitat fragmentation	The breaking up of once continuous habitat into smaller and more isolated remnants as a result of agriculture, urban development, or some other (often human-caused) event or set of events.
Herbaceous	Low-growing plants that die back to the soil level at the end of the growing season. In this context, referring to the ground layer of vegetation.
Hibernacula	Places of hibernation or dormancy, for example caves where bats spend the winter in a state of inactivity.
Hydrology	Study of the movement, distribution, or quality of water.
Incidental take	Under the Federal Endangered Species Act, the "take" (loss of or harassment of) a species "incidental" to some other action; that is, the take is not the primary intent of the activity, but it is a result of the activity.
Inflorescence	A group or cluster of flowers on a stem.
Informal consultation	Under Section 7 of the Federal Endangered Species Act, informal discussions or correspondence between Federal Agencies to determine whether a proposed activity might affect protected species. Informal consultation can end when the agencies agree that there will be no adverse affect, or it can be elevated to formal consultation.
Insectivores	Animals which feed primarily on insects.
Instar	A developmental stage of arthropods or insects, with each instar separated by a molt, or a shedding of the exoskeleton.
Interdunal	Low, usually wet, areas between dune ridges.
Jurisdictional wetlands	Wetlands regulated by the U.S. Army Corps of Engineers.
Larva (or larvae)	The young or juvenile stage of an animal.
Libellulids	A group or family of dragonflies, including many common and widespread

	species.
Loess	A type of soil deposited by wind.
Marsh	A type of wetland dominated by emergent vegetation such as cattail or bulrush, but usually without trees or shrubs.
Mesic	A habitat type with a moderate or well-balanced amount of moisture.
Mesic prairie	A moderately moist prairie or grassland.
Metapopulation	A group of populations connected by occasional or infrequent dispersal; thus, if one sub-population goes extinct, it may eventually be recolonized from a nearby source population.
Mycorrhizae	A usually symbiotic association between a fungus and the roots of a plant.
Perennial	A plant that lives for more than two years, with root stock persisting through dormant periods.
Photosynthesis	The process by which plants convert sunlight to energy.
Physiographic	Referring to a region described on the basis of topography, rock type, geology, or related physical processes.
Pinnately	Feather-like or multi-divided leaves.
Pollination	The process that transfers pollen grains from one plant to another; in the context of this document, pollination by insects carrying pollen among plants.
Prescribed burning	Intentional or planned burning as a management tool, usually to halt the spread of woody plants and to encourage native fire-adapted species.
Post-glacial	Usually referring to events, such as water and windborne sediment deposition, associated with the melting and retreat of the glaciers approximately 12,000 years before present.
Primordia	Young leaves, recently formed from the shoot.
Proximate	Nearby, in proximity.
Pupae	A life stage of some insects, a period of dormancy during metamorphosis from larva to adult.
Qualitative	Involving a high degree of subjectivity; not quantitative.
Quantitative	Measured, or measurable; documented in numbers.
Riparian	The interface between land and stream; often, a distinctive vegetation community along a streambank.
Rivulets	Small streamlets, in the context of this document referring to Hine's emerald dragonfly habitat, and usually less than a foot wide and less than a foot deep; usually with slow but visible flow, and usually originating from a seep or spring and flowing through marsh or sedge meadow.
Safe Harbor Agreement	Under the Federal Endangered Species Act, an agreement between U.S. Fish and Wildlife Service and a private landowner which assures that the landowner will not be penalized for actions such as land management which attract or increase populations of protected species. A Safe Harbor Agreement can authorize certain levels of "take" consistent with the overall land management objectives.
Savanna	An open wooded community, in the Chicago region usually defined as widely spaced oaks with a canopy cover of 5 to 30 percent.
Sedge meadow	A type of wetland dominated by sedges, often with a tussock-forming growth

	habit.
Seed broadcast	Spreading seed by hand or with light machinery.
State-listed	An animal or plant protected under a state endangered species act.
Stochastic	A process with both predictable and unpredictable outcomes; a certain amount of randomness limits predictive ability. For example, wildfire and flooding are stochastic processes which occur at variable intervals. In the long term, stochasm results in a more diverse ecosystem.
Successional	The process by which one plant community replaces another in a relatively predictable sequence; for example, gradual encroachment of woody vegetation into a prairie in the absence of fire.
Symbiotic	A cooperative relationship, one which benefits both parties. For example, a fungus may draw nutrients from a plant root, and also increase water uptake ability, thus enhancing survival during drought.
Temporally	Relating to time.
Teneral	A state immediately following metamorphosis of an insect from larva to adult; usually characterized by a soft exoskeleton or wings and with adult coloration not yet completely present. In the case of Hine's emerald dragonfly, the condition is though to last hours to a day or two, during which time the wings are soft, flight ability is limited, and eyes gradually change color from dark brown to bright green.
Thermoregulation	Using air or ground temperature, sunlight, or shade to regulate body temperature.
Transects	Straight lines with defined start and end points and known direction, traversed by biologists during the gathering of data.
Typha	Cattails.
Wet prairie	A grassland community with the water table at or above the ground surface for part of the year.

Ref: STB Finance Docket No. 35087

Dear Ms. Johnson-Ball:

The Department of the Interior (Department) has reviewed the July 2008 Draft Environmental Impact Statement (DEIS) for the proposed Canadian National Railway Company and Grand Trunk Corporation (Applicants) acquisition of the Elgin, Joliet, and Eastern Railway Company (EJ&E). Coordination between the Surface Transportation Board's (STB) Section of Environmental Analysis (SEA) and the U.S. Fish and Wildlife Service (Service) began during the scoping process. With respect to resources or issues for which the Department or its bureaus have jurisdiction or special expertise, we offer the following comments and recommendations for your consideration.

GENERAL COMMENTS

The DEIS provides a considerable amount of general information on issues of concern to the Department, but detailed analysis is often lacking. The proposed action and alternatives, which include the construction of six new connections and the installation of 19 miles of double track, would result in environmental impacts of varying severity depending on the particular location within the project area. All alternatives would result in greater environmental impacts than the no action alternative. The DEIS does not adequately identify adverse impacts to the Service's trust resources (federally listed species and migratory birds) and does not fully disclose impacts to other wildlife. As a result, the DEIS fails to consider and describe appropriate mitigation for these environmental impacts.

There is confusion about which agencies own or manage conservation lands in the two affected States, where conservation lands are located in relation to either the EJ&E or CN tracks, and about lands that have utilized Land and Water Conservation Fund monies, among other issues. A major problem in sections of the DEIS dealing with the Indiana portion of the project is a failure to provide adequate maps and descriptions of the main line and other tracks in the

Gary/Hammond/East Chicago/Whiting area (Lake Front Line, City Track, etc.) so that specific locations of important natural resources areas can be ascertained in relation to the tracks (Figures 2.1-1, 3.1-1, and 3.11-1 are not of sufficient detail to be adequate; Figure E-1, Sheets 29 through 32, provide better detail but do not name the tracks or provide the Segment numbers that are used throughout the text). The text does not clearly distinguish between the EJ&E main line and other EJ&E tracks in the discussion of project impacts. In particular, the proximity of any EJ&E tracks to the Indiana Dunes National Lakeshore is not clearly apparent, other than the Gaylord Tract in Griffith.

The specific comments below address these concerns in more detail and provide recommendations to correct these deficiencies in the final EIS. We also recommend that SEA coordinate further with the Service to resolve differences of opinion concerning project impacts to Service trust resources. If differences remain, SEA should ensure that the opposing views are disclosed and adequately discussed in the final EIS.

SPECIFIC COMMENTS

Proposed Action and Alternatives (Chapter 2)

Section 2.2.1.4, Planned Phased Integration of Applicants' Operating Plan: This section discusses the proposed phased implementation of the CN take-over of the EJ&E system. The Lake Front Line and Whiting Branch are mentioned several times, but no mention is made about the Hammond Branch, City Track, or the other tracks listed on Table 3.3-2 of Appendix E. It is indicated that service would not change on the Whiting Branch, but in Phase 3 there would be longer trains on the Lake Front Line, which essentially borders Lake Michigan through northwestern Gary and northern East Chicago, Whiting, and Hammond, Indiana to South Chicago, Illinois. These longer trains on the Lake Front Line are not discussed in Chapter 4, Environmental Consequences, section of the DEIS, despite the fact that these longer trains could adversely impact other existing and proposed uses of the Lake Michigan shoreline (e.g., the Marquette Plan, including a trail).

It is also not clear which track borders the north side of Clarke and Pine and Pine Station State Nature Preserves, west and east, respectively, of Clark Road in Gary. (Table 3.3-2 in Appendix E lists 2 at-grade crossings of Clark Road using names not found anywhere in the text.) Because these habitats are unique, this track and any changes or lack of changes in operation need to be mentioned here and discussed in Chapter 4, Environmental Consequences.

Section 2.4.1, Rail Connection Alternatives-Munger, Illinois: This section describes all of the alternatives considered for the six proposed rail connections, including the proposed and no-build alternatives. The Service supports the No-build at Munger alternative to avoid direct or indirect impacts (noise) to Service trust resources (migratory birds) that would result from the Munger build alternatives in Pratt's Wayne Woods Forest Preserve (PWWFP). As the DEIS notes in Section 3.11.6.3, PWWFP provides important habitat for state listed, wetland, and grassland birds. If a build alternative is chosen, the Service supports the Applicant's Proposed Munger Connection (Section 2.4.1.2) because changes were made to the Original Munger alternative to avoid PWWFP land (wetlands in particular). The Munger Alternative-UP Connection would also avoid wetland impacts at PWWFP; however, other offsite environmental

impacts (impacts to the southern end of Pratt's Wayne Woods and Brewster Creek Fen Nature Preserve) would result from this alternative.

Section 2.4.2, Rail Connection Alternatives-Joliet, Illinois: The Service supports the No-build at Joliet alternative to avoid direct impacts with the Hine's emerald dragonfly which occupies habitat in the vicinity of this alternative. This issue will be addressed in Section 4.11, Biological Resources and should be addressed in the final EIS.

Table 2-9: This table presents a summary of potential environmental impacts due to changes in rail operations. We disagree with several of the conclusions made by SEA in regard to impacts on biological resources. The conclusions are located in the proposed action column. Specifically, we disagree with SEA's conclusions that the proposed action would not have an adverse effect on plant communities, wildlife, conservation and natural areas, wetlands, federally listed species (including the Hine's emerald dragonfly), state listed species, and water resources. Since land not currently used for railroad purposes will be taken for the proposed rail connections, plant communities and wildlife habitat will be affected and, in some cases, wetlands will be filled. Stating that wetlands would not be affected "as no changes in drainage patterns would occur" is incorrect. The filling of wetlands will adversely affect the wetlands whether or not drainage patterns are modified by the filling. Some conservation lands will be adversely affected by increases in numbers of trains passing them, with resultant noise and air pollution impacts. We disagree with the conclusion that the noise level increase of 65 dBA or greater would not result in adverse effects. These statements in Table 2-9 do not agree with the discussion of project impacts in Chapter 4, Environmental Consequences. These discrepancies should be addressed in the final EIS.

Table 2-10: This table presents a summary of potential environmental impacts for the Munger Connection. We agree with SEA's conclusion that the Proposed Munger Connection would result in "increased noise and indirect loss of habitat, potentially decreasing the breeding activity of marsh birds." However, this conclusion should be made for the Munger-Original Proposal and Munger-Northwest Quadrant alternatives.

We disagree with SEA's conclusion that there would be no effects to federally listed species. This determination cannot be made for the eastern prairie fringed orchid without conducting a habitat assessment or surveys in suitable wetland habitat. The conclusion in the table should be revised in the final EIS. This issue is addressed in greater detail in our comments regarding Section 4.11, Biological Resources.

Table 2-11: This table presents a summary of potential environmental impacts for the Joliet Connection. We disagree with SEA's conclusion that there would be no effects to federally listed species. As noted above, the proposed construction could result in take of the Hine's emerald dragonfly. The conclusion in the table should be revised in the final EIS. This issue is addressed in greater detail in our comments regarding Section 4.11, Biological Resources.

Tables 2-12 and 2-16: These tables present summaries of potential environmental impacts for the Matteson Connection and for proposed double tracking. We disagree with SEA's conclusion that there would be no effects to federally listed species since this determination cannot be made for the eastern prairie fringed orchid without conducting a habitat assessment or surveys in

suitable wetland habitat. The conclusions in the tables should be revised in the final EIS. This issue is addressed in greater detail in our comments on Section 4.11, Biological Resources.

Table 2-13, Summary of Potential Environmental Impacts – Griffith Connection: This table indicates that there would not be an effect on local parks, but in Chapter 4, Environmental Consequences, it is acknowledged that the Griffith Historical Park and Depot Museum may be affected to some extent because it is immediately adjacent to the proposed connection. This table also states that there would be no effect on wildlife, despite the fact that several acres of prairie, woodland, and wetland habitat would be converted to railroad embankments and tracks. Chapter 4, Environmental Consequences, acknowledges that wildlife will be impacted by this connector. These discrepancies should be addressed in the final EIS.

Table 2-14, Summary of Potential Environmental Impacts – Ivanhoe Connection: This table also states that there will be no effect on wildlife. However, birds and small mammals that utilize the existing remnant prairie along the south side of the CSXT tracks will lose habitat. Under Biological Resources, it is indicated that there will be "potential effect on wetlands and dry woodlands species" of State-listed threatened and endangered species, but under Water Resources, it is stated that the project "would not affect wetlands." This inconsistency needs to be addressed.

Table 2-15, Summary of Potential Environmental Impact – Kirk Yard Connection: This table makes similar statements about potentially affecting wetland and prairie species of threatened wildlife, while not affecting wildlife or wetlands. These inconsistencies need to be corrected.

Affected Environment (Chapter 3)

Section 3.1.2.2, Yard Operations: This section states that the Whiting Yard in Indiana is located "just southeast of Kirk Yard," although it is actually about 6 miles northwest of Kirk Yard.

Section 3.3.1, Regional and Local Highway Systems: The discussion in this section, as well as in section 4.3.1, of existing conditions and with-the-project conditions of highway/rail at-grade crossings in Gary, Indiana, does not adequately describe the crossing situation in that community. At this time, the only grade-separated crossing of the EJ&E tracks with a roadway in Gary is Industrial Highway (former US 12) near Gary-Chicago International Airport. Industrial Highway has an at-grade crossing of the CSXT Railroad double main line track a short distance northwest of the EJ&E grade separation. However, Chicago Avenue intersects Industrial Highway in the same general area, parallel to the CSXT tracks, and has an interchange with Cline Avenue/SR912. This configuration will change, however, when the EJ&E tracks are moved around Gary-Chicago International Airport, at which time the grade-separation will be removed and at-grade crossings will be provided at Industrial Highway and Chicago Avenue. At some unknown date, a grade separation will again be provided over Industrial Highway and Chicago Avenue will be closed. However, the airport's ultimate plans, not covered under the 2005 FAA Record of Decision, are to close Industrial Highway entirely in order to lengthen the north-south runway.

Fifth Avenue (US 12-20) is a 4-lane highway that is the main entrance to the west side of Gary and includes an interchange with Cline Avenue about 0.5 mile west of the EJ&E at-grade crossing; it is a Department of Transportation designated heavy truck route that traverses the city

west to east. This highway is not even mentioned on page 3.3-37. Ninth Avenue is a 2-lane city street that crosses the EJ&E at-grade. It does not intersect with Cline Avenue and currently does not proceed into Hammond but connects with a service road parallel to Cline Avenue that connects with 15th Avenue. Therefore, it is not an alternative to either 5th or 15th Avenues. Fifteenth Avenue is a 2-lane city street serving commercial and industrial properties near the EJ&E at-grade crossing and mostly residential properties to the east; 15th Avenue intersects with Cline Avenue. Twenty-fifth Avenue is a 2-lane city street primarily serving residential areas; it does not intersect with Cline Avenue, but does proceed into Hammond. The seven unnamed roadways that have grade separated crossings of some part of the EJ&E tracks in Gary need to be named, and it should be acknowledged that they are not main entrances to the city from the west over the EJ&E double track main line.

Therefore, at this time, only Industrial Highway and Chicago Avenue are available to provide unobstructed access to the west side of Gary from Cline Avenue, which is the main north-south highway connection to Interstate Highways 80-94 and 90, area steel mills, and adjacent communities west of Gary. This unobstructed entrance will be lost during the unknown time period after the initial relocation of the EJ&E tracks around Gary-Chicago International Airport and before the construction of the Industrial Highway grade separation over the EJ&E (even though Industrial Highway may eventually be closed). With increased numbers of trains and longer trains on the EJ&E tracks with the project, access to and from the west side of Gary to Cline Avenue and adjacent communities could be significantly compromised unless another grade separation is provided.

This possible traffic impairment into and out of Gary is of concern to this Department because of the proximity of Ivanhoe Dune and Swale Nature Preserve and Ivanhoe South Dune and Swale to both the EJ&E tracks and 5th Avenue. Since 5th Avenue/US 12-20 is the major highway access for western Gary, it would appear that a grade separation will be needed at this location, regardless of the current and estimate traffic volumes (Level of Service) discussed in the DEIS. Either a grade separation of the EJ&E over 5th Avenue or 5th Avenue over the EJ&E would likely adversely impact the Ivanhoe Dune and Swale natural area complex. These preserves support the federally endangered Karner blue butterfly (*Lycaeides melissa samuelis*) and numerous Indiana-listed species of plants and animals. These dune and swale habitats are recognized as a Globally Imperiled Ecosystem.

Therefore, we request that the Surface Transportation Board provide a detailed discussion of the possible need for a grade separation at 5th Avenue/US 12-20 and the EJ&E Railroad, as well as the environmental consequences of such a separation, in the final EIS. Either grade separation structure would require retaining walls rather than side slopes in order to reduce the footprint of the structure and the impact on the Ivanhoe preserves. We believe that it is necessary for STB to address this issue because a grade separation would not be needed at this location "but for" the proposed project.

The discussions about Hammond, East Chicago, and Whiting need to make clear that the EJ&E lines being addressed are not the main line extending south and west from Kirk Yard into Illinois, which is the line that will experience the increases in numbers and sizes of trains. These cities are instead along lightly used spur lines that apparently would not have increased traffic as a consequence of the project.

Section 3.3.4, Airports: This section, as well as section 4.3.4, needs to discuss the ultimate plans of Gary-Chicago International Airport to close Industrial Highway at some unknown time in the future if the north-south runway is to be extended.

Section 3.5, Land Use: This section describes the land at the proposed Griffith connection between the CN and EJ&E Railroads as "vacant land." This land is apparently not zoned but is just there, unoccupied by a specific use. Based upon the Service's review of the area, it would more naturally be called "open space" since it consists of dry sand prairie, wetland, and savanna/woodland. Several abandoned rail rights-of-way cross the site, but native habitats dominate. Zoned "land use" does not necessarily describe the current land use, as is the case at this site. This same type of distinction can be made at the proposed Ivanhoe connector site, which is apparently zoned "open space" but is primarily industrial land, except for remnant prairie along the south side of the CXST track. "Open space" is the correct designation for the Ivanhoe dune and swale complex north of the proposed Ivanhoe connector.

Section 3.5.5, Public Lands: This section discusses various types of public lands in the project area but leaves the reader very confused about the subject. Both Indiana and Illinois have Nature Preserve systems; Indiana has County Park systems and no Forest Preserve systems; Illinois has Forest Preserve systems and no County Park systems within the counties affected by the proposed project. These distinctions are not made clear in this Public Lands discussion. This section needs to clearly explain the similarities and differences in the public land systems between Indiana and Illinois. For example, Table 3.5-2, Forest Preserves Adjacent to the EJ&E Rail Line, does not make clear that this system exists only in Illinois; all it states is that there are no forest preserves located near the EJ&E rail line in Lake County, Indiana. A reviewer unfamiliar with the distinctions between the two State systems would therefore believe that there are no designated, significant natural habitats along the EJ&E line in Indiana, which is not the case.

Section 3.5.5.6, Nature Preserves, and Table 3.5-3: The information provided in this section is also confusing. Listed lands are described as "south of" or "west of" the EJ& E line, but there is no indication if they are immediately adjacent to the main rail line or one of the spur lines, which is the important issue. Hoosier Prairie in Griffith is, in fact, along both the CN line and the EJ&E line. When the entire site is considered, it is about 600 acres in size, not the 430 acres listed in the table. Ivanhoe Dune and Swale is east, not west, of the EJ&E main line. Clarke and Pine and Pine Station Nature Preserves are along the south side of one of the spur lines of the EJ&E; this line should be named in the table.

Table 3.5-4, Resource-Rich and Protected Areas Adjacent to the EJ&E Rail Line: This table is also very confusing. Apparently, this terminology is used only in Illinois for specific resources; however, this is not made clear either in the discussion or in this Table. The last line of the table states that "No protected areas are located near the EJ&E rail line in Lake County, Indiana." This would lead the reviewer to conclude that there is nothing of importance along the EJ&E Railroad in Indiana, which is clearly not the case. Therefore, it must be made clear that this Resource-Rich and Protected Areas designation refers only to Illinois; any references to Indiana need to be removed.

Table 3.5-9, Trails and Greenways in Lake County, Indiana: This table is incorrect about most of the trails. The Northwest Indiana Regional Planning Commission (NIRPC) does not manage

the trails, although they published the regional trail map and are involved in trail planning. The Little Calumet River Trail is a component of the Little Calumet River Flood Protection and Recreation Project being constructed by the Chicago District, U.S. Army Corps of Engineers, with the Little Calumet River Basin Development Commission (LCRBDC) being the local sponsor and the trail manager, in conjunction with the cities and towns the trail passes through. The trail is located, or will be located, along levees either north or south of the river and crosses the EJ&E min line tracks in Griffith. The Grand Calumet River and Marquette Corridor Trails do not exist, although there is a Marquette Trail on a portion of an abandoned Indiana Harbor Belt (IHB) rail corridor within the Indiana Dunes National Lakeshore (INDU) in Gary. The Marquette Trail is administered by INDU. The plan is for a trail near the Lake Michigan shoreline of Indiana between Illinois and Michigan, not Ohio. The only part presently existing is in the vicinity of Whihala Beach County Park in Whiting, which may mean it is near the EJ&E Lake Front Line. Portions of the Grand Calumet River trail are in the planning stage; it will be constructed on city streets and the river shoreline both north and south of I-90/Indiana Toll Road. The Oak Savanna Trail is along an abandoned railroad grade and is administered by the Lake County Parks and Recreation Department. The Prairie Duneland Trail is also along an abandoned railroad grade and is administered by Portage, Chesterton, and Porter County.

Table 3.5-11, Land and Water Conservation Fund Properties: This table omits Hoosier Prairie and Clarke and Pine Nature Preserves, although both have received funding from the Land and Water Conservation Fund. We acknowledge that the National Park Service Website references (http://waso-lwcf.ncrc.nps.gov/public/index.cfm) do not list these two properties, but information about the funding is available from the Indiana Department of Natural Resources, Divisions of Outdoor Recreation and Nature Preserves.

Section 3.10.2, Existing Conditions: This section describes the existing conditions with respect to noise and vibration. It describes the Kirk Yard as being "between the shore of Lake Michigan to the north, the US Steel Gary Works to the east, an interstate highway to the south, and rail lines to the west." However, Kirk Yard is not along the shoreline of Lake Michigan; it is inland about a mile and the US Steel Gary Works is between it and the Lake.

Section 3.11, Biological Resources: This section describes the biological resources of the Study Area, which is a 1-mile-wide corridor centered on the EJ&E and CN rail lines.

Section 3.11.1, Background, and 3.11.6, Conservation and Natural Areas within the Illinois Study Area: Figure 3.11-1 in section 3.11.1 displays natural areas that would be affected by the proposed action and section 3.11.6 describes the natural areas. We note that the northern portions of MacArthur Woods and Middle Fork Savanna were not highlighted on the figure and were not described in these sections. These forest preserves are located along the EJ&E arch and provide habitat for Service trust resources. Therefore, the final EIS should highlight and describe these natural areas.

Figure 3.11-1 should be revised to designate the rail lines by segment number, since segment numbers are used in the text.

Table 3.11-1, Invasive and Nonnative Plant Species: Spotted knapweed (*Centaurea maculosa*) is another significant nonnative, invasive plant species that should be added to the list in this table and discussed in section 3.11.3.2, particularly since it is prevalent along railroad rights-of-way.

Table 3.11-2, Common Wildlife Species in the Study Area, and Table 3.11-3, Common Migratory Birds in the Study Area: These tables actually list many species that are very uncommon in the area, including those that are Indiana and/or Illinois listed rare species, as shown in Table 3.11-7, State-listed Threatened & Endangered Species Potentially within Illinois and Indiana Study Area. Common species would instead include American robin, blue jay, gray squirrel, white-tailed deer, and similar species that have adapted to living in human-dominated habitats. The rarer species are most often found within the Nature Preserves, Forest Preserves, and other significant habitats. Osprey, black-crowned night heron, and common loon are not "common" migratory birds within the study area (Table 3.11-3). Some of the birds listed migrate through the area but are not known to nest, while others on the list are known nesters.

There is also a large heron rookery in Lake County, Indiana, west of Cline Avenue and south of the Little Calumet River, which is about a mile west of the EJ&E main line. Although the rookery itself is outside of the mile-wide Study Area, the birds feed along the river in the vicinity of the railroad river bridge and numerous other locations along the river and area wetlands. Great blue heron, great egret, green heron, and black-crowned night heron have been known to nest at this rookery.

Section 3.11.7, Conservation and Natural Areas within the Indiana Study Area: This section mentions "county forest preserves," but Indiana does not have a County Forest Preserve system, instead having a County Park system. This section continues the confusing conservation land discussions mentioned previously in our comments and needs clarification. Table 3.11-5 and the discussion in this section need to indicate what community the various lands are located in, particularly since some of them are not shown on Figure 3.11-1. We have no idea if any of the unnamed high quality natural communities discussed include the EJ&E prairie, which is located east of Clark Road at the west end of the Kirk Yard. This sand prairie and wetland complex is a remnant dune and swale habitat not far from Clarke and Pine and Pine Station Nature Preserves and is an area the Indiana natural resources agencies are interested in preserving and enhancing, possibly as mitigation for the impacts of this STB project. This area is discussed further in our comments on Chapter 6, Mitigation.

Except for the Gaylord Butterfly Tract, the Hoosier Prairie State Nature Preserve is owned and managed by the Indiana Division of Nature Preserves, even though it is a component of the Indiana Dunes National Lakeshore and a National Natural Landmark. The Gaylord parcel is south of the main section of Hoosier Prairie and is adjacent to the south side of the EJ&E right-of-way in Segment 5B. Hoosier Prairie also includes an 18-acre parcel adjacent to the south side of the EJ&E main line immediately west of Kennedy Avenue.

The discussion of Clarke and Pine and Pine Station Nature Preserves should identify which EJ&E track is adjacent to the properties. Pine Station is both north and south of the Grand Calumet River and it is both owned and managed by the Indiana Division of Nature Preserves.

It is not clear why the Indiana Dunes National Lakeshore is mentioned, because other than owning the Gaylord Butterfly Tract in Griffith, it appears that INDU is not located along any of the EJ&E tracks. Therefore, the proximity of INDU to any of the EJ&E tracks needs to be clarified.

Section 3.11.8, Threatened, Endangered, and Sensitive Species: This section describes the federally listed species that have the potential to occur in the study area. In reference to the Hine's emerald dragonfly, it is noted that the Service has an agreement with EJ&E rail line for train operations on the Paul Ales Branch and that trains operate between 4 to 6 miles per hour to reduce adult mortality from direct train collisions. Furthermore, the DEIS notes that the reduced speeds minimize impacts to larval Hine's emerald dragonflies from "squishing" ground water from beneath the railbed, releasing sediments into larval habitat next to the railroad embankment. The final EIS should clarify that the speed limits were imposed by the special conditions of the 1996 U.S. Army Corps of Engineers (COE) permit (Permit # 199600211). Additionally, it should be clarified that the there is not an agreement in place between EJ&E and the Service; Commonwealth Edison was the applicant for the 1996 permit. It is our understanding that EJ&E operates trains on the line, the Metropolitan Water Reclamation District owns the land within the right-of-way, and Midwest Generation owns the rail line.

In reference to habitat for the eastern prairie fringed orchid, the EIS should also list wet to mesic prairie and marsh edges as suitable habitats. The DEIS notes two locations where the orchid was last recorded in the vicinity of the EJ&E. However, the orchid could be found in suitable wetland habitat throughout the study area and, as noted above, habitat assessments need to be conducted to determine whether suitable habitat is present.

Concerning the Karner blue butterfly, no critical habitat has been designated for the species anywhere throughout its range, so the Study Area is not the only area with no designated critical habitat. All of the Karner blue's larval stages utilize wild lupine (*Lupinus perennis*) as their sole food source, not just "several" of them.

In its February 12, 2008, letter to STB concerning the Draft Scope of Study for Finance Docket No. 35087, the Service's Bloomington, Indiana, Ecological Services Field Office stated that the proposed project area is within the range of the federally endangered Indiana bat (*Myotis sodalis*). The Service indicated that this species may be found along the floodplain of the Little Calumet River, which is crossed by the EJ&E main line tracks. However, this species is not listed on table 3.11-6 and is not discussed in this section of the DEIS. Based upon knowledge of the species, it is the position of the Service that the Indiana bat is considered to be present in suitable habitat unless proven otherwise. The Little Calumet River floodplain is considered suitable habitat although no studies have been undertaken along the river corridor in Lake County to prove or disprove the presence of the Indiana bat. The species is known along the East Branch of the river in adjacent Porter County. We therefore request that the Indiana bat be addressed in this section of the final EIS, as well as in section 4.11.

Section 3.12, Water Resources: This section discusses the various permits that may be needed by the Applicants because of project impacts to wetlands and/or Waters of the United States or Waters of the States. However, it confuses the Indiana Department of Environmental Management's (IDEM) Section 401 authority with the Federal Consistency Review requirements of the Indiana Department of Natural Resources. These are two separate and distinct reviews done by different agencies. Also, the discussion only addresses use of Nationwide Permits or the Indiana Regional General Permit No. 1, not the procedure if an individual permit is required under Section 404 of the Clean Water Act or Section 10 of the 1899 Rivers and Harbors Act. Both types of permits need to be discussed.

Section 3.12.5, Wetlands: This section notes that the Applicants would be required to conduct wetland delineations as part of Section 404 of the Clean Water Act. The Service recommends that the delineations and habitat assessments (e.g., Floristic Quality Assessments) be conducted during the growing season for greatest accuracy and reliability.

This section also needs to acknowledge publicly owned wetlands along the Little Calumet River in Lake County, Indiana. These wetlands are owned by the LCRBDC as part of the flood control project lands.

Environmental Consequences (Chapter 4)
As stated previously, we believe that a grade separation will likely be needed at 5th Avenue in Gary, Indiana, because it is the main west-side access into and out of the city. Therefore, the consequences of such a structure need to be addressed in this section.

Section 4.2.5, Hazardous Material Transportation Safety: This section needs to indicate whether or not herbicides and pesticides that could impact wildlife will be carried by the trains and may be released in an accident. If such materials spilled near a site containing endangered wildlife, such as the Karner blue butterfly, the population could be decimated before containment and clean-up is achieved. Temporarily restricting use of a water body that has received a spill may help keep humans away, but it will not help the wildlife that utilize the water body and cannot escape it.

Section 4.5, Land Use: This section states that the proposed action would not affect public lands in Indiana (page 4.5-3). We disagree. The Gaylord Butterfly Tract and the Hoosier Prairie 18-acre Kennedy Avenue tract would be affected by proximity effects, such as increased noise, because they are immediately adjacent to the EJ&E main line. The 18-acre Kennedy Avenue tract could also be impacted by any changes to the at-grade crossing at location. As previously noted, both Clarke and Pine and Hoosier Prairie Nature Preserves are Section 6(f) Land and Water Conservation Fund properties.

Construction of the Griffith connector (page 4.5-11) may not impact land use patterns, but it would certainly impact current use at the site, which is undeveloped open space. This is described as 3.25 acres of vacant land, which is actually sand prairie, wetland, and savanna/woodland. Section 4.11, Biological Resources, states that although there are natural habitats in the proposed connection areas, "the affected wildlife habitat is general minor [sic] and wildlife is mobile" so the proposed construction would not affect wildlife. This no-effect is not accurate. Wildlife forced to move from their habitat or die are "affected"; any eggs or immobile individuals will be killed. Wildlife do not necessarily have other habitats to move into because those habitats are already occupied. Wildlife have specific home ranges of certain sizes, and wildlife cannot be "stacked" into remaining habitats. Therefore, all of the wildlife species utilizing the 3.25 acres of natural habitat at the Griffith connector will be adversely affected through loss of habitat. These wildlife include insects, amphibians, reptiles, birds, and mammals. More detailed descriptions of the habitats at the Griffith connector site are necessary (page 4.11-16). The wetland at the Griffith connector site is not just a palustrine emergent seasonal type; it also includes scrub-shrub and forested components (Table 4.12-7, Wetland Effects from Proposed Connections). We agree that a botanical survey is necessary at the Griffith connector site prior to construction. Such a survey is also needed at the Ivanhoe connector site because of the remnant prairie along the south side of the CSXT tracks.

Section 4.10, Noise and Vibration: This section discusses noise impacts from the proposed action and estimates the number of noise-sensitive receptors that would be affected by increased average noise levels (in dBA). However, SEA's analyses only considered noise impacts on humans and did not consider the effects of noise on wildlife (specifically migratory birds), although the effects on wildlife are mentioned in Section 4.11. In this section, SEA determined that noise levels less than 65 dBA are generally not considered adverse to human health and welfare. SEA also determined that the majority of the EJ&E segments would experience noise levels of 65 dBA or greater and that seven of the segments would experience noise levels of 70 dBA or greater. The noise levels for some of these segments could approach 100 dBA since the existing noise levels at some of the monitoring stations in Table 3.10-2 show dBAs currently above 80 dBA and up to 92 dBA. In addition, average sound exposure levels (SEL) for locomotives horns, locomotives, and rail cars along the EJ&E are 104.1 dBA, 93.9 dBA, and 91.7 dBA, respectively.

Section 4.10.1.1 of the DEIS notes that the Board requires an evaluation of potential noise effects as part of an environmental analysis. However, SEA did not evaluate the potential noise effects on a major component of the environment, wildlife. Research exists that indicates thresholds for which adverse effects would be seen in wildlife, particularly in migratory birds. The issue of noise impacts to migratory birds is discussed in more detail in our comments on Section 4.11. Because of the numerous natural areas located adjacent to the EJ&E arch and the potential for adverse effects from the increased noise levels, noise impacts and their effects on wildlife should be considered and discussed in this section of the final EIS.

Sections 4.11.1 and 4.11.3, Biological Resources: These sections present the methodology SEA used to determine potential effects from the proposed action on biological resources and details the potential effects by category. In the summary of findings, we agree with the statement that wildlife and natural areas would experience a higher probability of exposure to hazardous material spills and that bird populations may experience behavioral or physiological effects and masking of communication signals because of increased noise. We also agree that several forest preserves, nature preserves, and state parks would be affected by the increased train traffic. However, we do not agree with the determination that only bird populations within 500 feet of the rail line could be affected. This issue is discussed in greater detail in our comments below on Section 4.11.3.1, Proposed Changes in Rail Line Operations-Wildlife.

We disagree with the finding that only the Hine's emerald dragonfly and Karner blue butterfly could be affected by the proposed action. As noted above, determinations about the eastern prairie fringed orchid cannot be made without surveys or habitat assessments such as a Floristic Quality Assessment. We also disagree with the finding that changes in rail operations would not affect the Hine's emerald dragonfly and that the orchid only has the potential to occur at the Proposed Griffith Connection.

We disagree with several of the conclusions at the end of section 4.11.3, which are:
(1) the risk of hazardous materials spills would increase but the probability is still remote,
(2) the probability of train/animal collisions would increase but would remain low,
(3) the noise effects to wildlife, particularly migratory birds, would increase but effects are expected to remain slight, and
(4) impacts to the Hine's emerald dragonfly from ground vibration are not expected to change.

The final EIS should discuss the benefits of the proposed actions on wildlife, as a result of reduced train activity inside of the EJ&E arch. For example, based on maps provided, existing adverse impacts (e.g., noise, collisions) to wildlife would be reduced on the Freeport Subdivision (south of Schiller Woods Forest Preserve), the Joliet Subdivision (along the Palos Preserves), and the South Bend Subdivision (north of Wampum Lake Woods and Thornton Lansing Road Nature Preserve).

Section 4.11.3.1, Proposed Changes in Rail Line Operations -Wildlife: This section acknowledges that rail line operations would lead to increased noise (see above). Numerous studies investigating the effect of noise on wildlife have been conducted. In this regard, birds have been studied the most (with most of those studies involving the effects of traffic on birds). Very little research has been completed showing the affect of railroad noise on birds. However, a recent study by Waterman et al. (2004) on meadow birds in the Netherlands showed that wetland birds were adversely affected by railroad noise levels ranging from 42 to 49 dBA.

The DEIS notes that several of the highway studies documented lower species diversity and lower breeding densities near roads and highway traffic. However, most of these studies do not conclusively show that noise is the main cause of these effects and that other variables associated with noise (e.g., visual disturbance) are not factors. In a series of studies in the Netherlands, Reijnen et al. (1987, 1995, 1996, 1997), Reijnen and Foppen (1994, 1995), and Foppen and Reijnen (1994) have shown that the number of breeding woodland and grassland birds have declined significantly near roads as a result of noise. The farthest distance for which reductions in the numbers of breeding birds were still observed from the roads was 1500 meters (4,921 feet). These studies also showed that noise levels as low as 50 dBA resulted in an adverse effect on breeding birds (with several studies showing an effect below 60 dBA). In these studies, 33 of 45 investigated woodland bird species were adversely affected by noise and 7 of 12 grassland species were adversely affected. Forman et al. (2002) also showed that several species of grassland birds (especially bobolink and eastern meadowlark) decreased in numbers and breeding densities near roads. Waterman et al. (2004) found adverse effects of railway noise in meadow/wetland bird species within 15 areas along existing railroads. These birds consisted mostly of shorebirds and ducks. The threshold noise level at which bird densities were adversely affected varied little among the species studied and, as noted above, ranged from 42 to 49 dBA.

Although it can be argued that the studies indicating an adverse effect on birds do not clearly isolate noise as an exclusive source of disturbance, it is widely agreed that noise has a negative effect on birds. The reference to the 500-foot distance as a threshold for reduction of adverse effects to birds can be disputed based on other studies showing an effect at longer distances (up to 1500 meters).

The DEIS identifies the numerous natural areas along the EJ&E arch and describes the vast numbers of migratory birds (including state listed species) that frequent these natural areas. Thus, the DEIS highlights the importance of these natural areas as bird concentration areas.

The final EIS should compare the predicted noises levels from the proposed action (including the increased number and frequency of trains) to noise levels and distances that have shown an adverse effect on migratory birds. Based on the studies reviewed by the Service showing adverse effects at greater distances than noted in the DEIS and adverse effects on breeding bird

densities at lower noise levels than noted in the DEIS, the proposed action would adversely affect migratory birds.

This section also notes that wildlife and natural areas would experience a higher probability of exposure to hazardous material spills and train collisions. SEA acknowledges the potential increase in the possibility of hazardous materials releases; however, due to regulatory and other safeguards in place, SEA believes the possibility of hazardous materials releases are remote. We disagree with this conclusion because, as SEA highlights, the increase in hazardous materials releases would increase with the increased amount of train activity. This increased probability would occur regardless of the regulatory safeguards currently in place. SEA evaluated the frequency of release (before and after the proposed action) of hazardous materials based on statistics provided by the Applicants. The results are shown in Table 4.2-23. However, these results and other results fail to support SEA's determination that hazardous releases are remote. The final EIS should provide data that shows the potential frequency of spills with the proposed number of carloads transporting hazardous materials per day (anticipated at up to 500 carloads per day). Table 4.2-23 shows potential intervals between anticipated hazardous material releases in years. The final EIS should also provide data that compares the frequency of spills (with the proposed number of carloads) with other rail lines transporting comparable numbers of cars per day over similar distances. This comparison of data could show whether the possibility of hazardous materials releases is remote.

Section 4.11.3.1, Proposed Changes in Rail Line Operations - Natural Areas: This section identifies four categories of risk to natural areas. Again, the 500-foot distance is provided; however, it is noted that animals in the area already live with daily noise from trains and therefore, noise could only have minor effects on wildlife and natural areas adjacent to the EJ&E arch. These statements do not take into account the increased number of trains proposed to operate on the EJ&E arch and the subsequent increased frequency of disturbance. Although it is acknowledged that some bird species habituate to increased noise levels, this ability to avoid the impacts of noise may be due to the fact that species able to habituate are native generalists or non-native colonizers (Kasloo and Tyson 2004, Slabbekoorn and Ripmeester 2008). Slabbekoorn and Ripmeester (2008) note that several of the native generalists or non-native colonizers are able to adapt to urban noise conditions. Rare and declining bird species along the EJ&E arch that would be subject to the increased number of trains may not be able to habituate to the increased disturbance levels because they are not native generalists, non-native colonizers, or urban species. Several of these species are on the Service's Region 3 Fish and Wildlife Resource Conservation Priorities (RCP) list and have also been identified as focal species by the Service's "Focal Species Strategy for Migratory Birds." In addition, several of these bird species are listed as endangered or threatened species by the state of Illinois.

The DEIS also notes that animals living in and passing along the EJ&E arch may be at higher risk of being struck by trains due to increased traffic. However, the DEIS goes on to state that these animals have adapted to the existing train traffic, and there would not be an effect on animal populations. For both conclusions, the final EIS should use analyses to support these claims, factoring in the increased number of trains and increased frequency of the trains traveling along the EJ&E arch. Lower densities and diversity of wildlife near roadways may be due in part to increased mortality from collisions with vehicles. We would expect to see increased mortality from collisions with trains if there is an increase in the number of trains.

Section 4.11.3.1, Proposed Changes in Rail Line Operations - Federally Listed Species: This section notes that vibration of the tracks causes sediments to be pushed from the rail bed into larval Hine's emerald dragonfly habitat, resulting in adverse impacts to Hine's emerald dragonfly larvae. It is also noted that the proposed action would not change operations on the Paul Ales Branch; therefore, the DEIS concludes that Hine's emerald dragonfly larvae would not be affected beyond current operations.

The DEIS notes the dispersal ability of adults, indicates (in Figure 2.2-1) that 42.3 trains would pass through the area per day, and that the risk of collisions for adults could increase in EJ&E Segment 9B (at the southern most end of designated Critical Habitat). A study in Door County Wisconsin demonstrated Hine's emerald dragonfly mortality that resulted from collisions with vehicles (Soluk and Moss 2003). We believe that Hine's emerald dragonflies would also be vulnerable to passing trains and that more trains would increase this risk. However, SEA concludes that increases in traffic on this segment are not likely to adversely affect the Hine's emerald dragonfly. The Service disagrees with this conclusion and questions how SEA made this determination given the information provided to them. As noted in Section 3.11.8.1, adult Hine's emerald dragonflies were observed in 2004 in the area of Segment 9B. More recent surveys in 2007 also identified adults in this area, which is less than 0.12 miles north of Segment 9B, well within the flight distance of an adult dragonfly.

We do not concur with SEA's conclusion that the proposed action would not adversely affect the Hine's emerald dragonfly. For this reason, we recommend that SEA consider requesting formal consultation as described in section 7 of the Endangered Species Act of 1973, as amended. We recommend that SEA inform the Applicants to consider carrying out actions that would enhance the habitat for Hine's emerald dragonflies, but that would not create an attractive nuisance near railroad tracks. SEA should request formal consultation if its actions would result in adverse effects to the listed species. For example, if SEA's actions would modify train speeds or modify numbers of trains on specific lines, then SEA's actions would directly or indirectly lead to adverse effects on the Hine's emerald dragonfly. SEA and the Applicants should also seriously consider joining in the effort to develop a Habitat Conservation Plan (HCP) in the lower Des Plaines River Valley. At present, the Applicants do not have the permission to take the federally listed species. The Endangered Species Act provides two possible approaches to an applicant to gain permission from the Service to take listed species. That permission may be granted after conducting a review necessary as part of a formal consultation. Permission to take may also be granted following review and approval of an HCP and accompanying section 10(a)(1)(b) permit application.

Table 4.11-2, Potential Effects on Federally Listed Species Along the EJ&E Rail Line Due to Operational Changes: Contrary to the information provided in this table, the Karner blue butterfly is not present in EJ&E Segment 5B.

Section 4.11.3.1, Proposed Changes in Rail Line Operations - State Listed Species: This section discusses the state listed species that occur in the study area. Although this section discusses state listed species, we provide comment because all the grassland, marsh, and rookery bird species listed in Table 4.11-3 are Service trust resources and most of them are listed as rare and declining bird species by the Service. Of the species listed in Table 4.11-3, Henslow's sparrow, short-eared owl, upland sandpiper, and king rail are on the Service's RCP and Focal Species lists. Black tern, common moorhen, least bittern, black-crowned night heron, and American

bittern are on the RCP list. Sandhill crane is on the Focal Species list. All of the birds on the RCP list are listed due to their rare or declining status and, therefore, have a need for special conservation attention. Focal species are those the Service is targeting for a return to healthy and sustainable levels.

Table 4.11-3 needs to include black-crowned night heron and Franklin's ground squirrel in the segment along Clarke and Pine and Pine Station Nature Preserves, since both species are found at these preserves. Henslow's sparrow is listed in the table as likely being present in Segment 4, which is the developed town of Griffith. We strongly doubt that this grassland species is present in the developed community, although it may be present along the CN Segment 33 at Oak Ridge County Park or CN Segment 23A at Hoosier Prairie.

This section also discusses increased Blanding's and spotted turtle mortality due to increased rail traffic. Although we agree with this assessment, we do not agree with SEA's conclusion that only minor effects are expected because habitat structure would not change and both species currently occur in the rail environment. The final EIS should address turtles being trapped between railroad rails and how increased train activity would result in longer periods of being trapped. Research has shown that prolonged periods of being trapped between railroad rails can result in mortality and physiological stress (overheating) on turtles (Kornilev et al. 2006).

Rookery species of birds could be adversely impacted by any activity that adversely impacts the Grand Calumet River and Little Calumet River, because herons and egrets regularly feed along these rivers, including near the EJ&E bridges.

Concerning Dune Invertebrate Species (page 4.11-13), the Gaylord Butterfly Tract and Hoosier Prairie Kennedy Avenue tract are directly adjacent to the EJ&E main line tracks and are not buffered from them by petroleum storage facilities.

Section 4.11.3.2, Proposed New Constructions/Connections - Wildlife: As noted above and in the DEIS, PWWFP is an important bird area and noise would adversely affect birds in the area. In addition to the increased numbers of trains, noise from construction could adversely affect breeding birds during the breeding season. This could be minimized by restricting construction during the breeding season (April – August). This recommendation holds true for all Munger alternatives except for the Munger-UP Connection alternative.

The section also states that "because the affected wildlife habitat is generally minor and wildlife is mobile, SEA determined the construction of the connections would not affect wildlife." We disagree with the determination and again note that the DEIS emphasizes the habitat value and diversity of state listed bird species at the Munger location. The presence of the high number of state listed species does not support the conclusion that the affected habitat is generally minor. Furthermore, no wildlife survey data have been provided for the Matteson alternatives, although the DEIS indicates that wetlands and wetland birds are likely present in the area of this connection. Therefore, based on the lack of supporting information, we cannot concur with SEA's determination. The final EIS should address these issues.

Section 4.11.3.2, Proposed New Constructions/Connections - Natural Areas: Refer to the comments above.

Section 4.11.3.2, Proposed New Constructions/Connections - Federally Listed Species: Figure 2.2-1 indicates that train activity would increase to two trains per day along the Joliet Subdivision, in the area of the Proposed Joliet Connection. Take of adult Hine's emerald dragonflies may be currently occurring on the Joliet Subdivision. An increase in train activity would result in further take. Adult Hine's emerald dragonflies were observed approximately 0.17 miles west of the Joliet Subdivision and approximately 1.10 miles northwest of the Proposed Joliet Connection in 2004. The Service has tried unsuccessfully to address the issue of take with Canadian National in the past (see enclosed letter). Due to the proposed increased train activity within the flight distance of an adult dragonfly, the Service concludes that the proposed action would likely adversely affect the Hine's emerald dragonfly and take could occur.

The DEIS notes that the eastern prairie fringed orchid could occur at the proposed Griffith Connection or wetland margins. As stated above, the orchid could be found in suitable wetland habitat throughout the study area, and surveys or habitat assessments need to be conducted in areas of new construction or double tracking to determine whether suitable habitat is present. Therefore, there is insufficient information to conclude that the orchid is not likely to be adversely affected.

Section 4.11.3.2, Proposed New Constructions/Connections - State Listed Species: Refer to the comments above.

Section 4.11.3.2, Proposed New Constructions/Double Track - Federally Listed Species: The Service agrees with SEA's determination that the orchid, mead's milkweed, and prairie bush clover could be affected by double track construction if suitable habitat is present. In addition to the proposed surveys, wetland delineations and habitat assessments should be conducted in wetland areas.

Section 4.12 and 4.12.3.2, Water Resources: The Service agrees with SEA's findings in this section that increases in rail traffic would result in a corresponding increase in the risk of hazardous spills, which could affect water resources. The DEIS notes that wetlands would be directly impacted during construction of connections and double tracking and that wetland delineations would be conducted as part of the permitting process. The final EIS should also indicate that habitat assessments should be conducted as well to determine if suitable habitat is present for the orchid and to help determine mitigation ratios for proposed wetland impacts.

Table 4.12-1, Potentially Affected Lakes and Preserves: This table lists conservation lands that contain water but fails to include Ivanhoe Dune and Swale and Ivanhoe South. These areas contain water/wetlands in the form of interdunal swales and should be listed on this table and discussed in the text.

Indirect and Cumulative Effects (Chapter 5)

Section 5.3, Potential Indirect Effects of the Proposed Action: In Section 5.3, SEA concludes that the proposed action could result in indirect effects from increased rail activity in the East Joliet and Kirk Yards and general indirect effects throughout the region. Section 5.3.1 discusses the general indirect effects of the project, **but does not** address any potential indirect effects on biological resources. This section does not disclose indirect impacts from the proposed action

and does not address indirect impacts to biological resources in the study area. The final EIS should address indirect effects to all biological resources listed in Chapter 4, or provide substantial documentation if the conclusion is that the proposed action would not result in indirect effects on biological resources.

Section 5.4, Related Projects, and Section 5.5, Site-Specific Cumulative Effects Analysis of Related Projects: These sections discuss past, present, and foreseeable cumulative effects on natural resources from the proposed action and at other areas outside the EJ&E right-of-way which should be considered in the cumulative impacts analysis as described in the National Environmental Policy Act (NEPA). In section 5.5.1, SEA concludes that the interaction between the proposed action impacts and the proposed Metra Star Line could result in minor cumulative impacts. Table 5.5-1 indicates that PWWFP would be affected and effects to biological resources would be minor. We believe that the impacts will be far more substantial than indicated in the DEIS. Departmental comments regarding Chapter 4 describe our concerns with respect to impacts of the proposed project to biological resources, particularly migratory birds. The impacts from the proposed action and the proposed Metra Star Line would occur along the same areas of the EJ&E arch and would adversely impact (specifically via noise) migratory birds in the same natural areas along the EJ&E arch. Furthermore, it is noted that the proposed Metra Star Line could result in a new dedicated track within the EJ&E right-of-way. A new track could have far greater direct construction impacts than the Applicants' proposal. The final EIS should more fully disclose the cumulative effects of the proposed Metra Star Line and the proposed project. The final EIS should address increased noise impacts and the increased probability of collisions with wildlife. Additionally, in the final EIS, Section 5.5.2 should provide figures depicting the locations of the proposed Star Line commuter stations so that determinations could be made about potential adverse impacts to natural areas and wildlife.

Mitigation (Chapter 6)

Section 6.2, Applicants' Voluntary Mitigation Measures: Chapter 6 discusses mitigation, including proposed voluntary mitigation measures offered by the Applicants as described in this section. We believe that a significant number of the Applicants' proposed mitigation measures are, in fact, best management practices that should be automatically required as part of the proposed action. Others, such as VM 64 concerning wetland fills and VM 65 concerning NPDES permits, are actions that are required by law and are not voluntary. Air quality VM 43, concerning switching to locomotives that emit fewer air pollutants, is commendable, but a time table needs to be established and adhered to. As stated, the proposal is open-ended on when it will occur, which could be many years away. The Applicants did not propose any mitigation measures to compensate for unavoidable impacts to biological resources.

Section 6.3, SEA's Preliminary Environmental Mitigation Measures: This section discusses the preliminary recommended environmental mitigation measures that are based on SEA's environmental analysis of the proposed action. SEA proposes mitigation measures to address effects not addressed by the Applicants' voluntary mitigation. We do not understand why adherence to required safety plans, including Occupational Safety and Health Administration (OSHA) requirements, is considered mitigation.

Several of the SEA proposed mitigation measures use terms such as "regularly inspect" or "communicate regularly" with other entities concerning noise and vibration (Nos. 24 and 26),

without defining "regularly". Noise and possibly vibration also affect wildlife, so a clearly defined inspection schedule should be required.

The Department's Recommendations for Additional Mitigation

As noted in our above comments, we believe that the DEIS does not fully disclose all potential project impacts to natural resources. To address these potential impacts, as well as to augment some of SEA's proposed mitigation measures, we offer the recommendations below. These recommendations should be added to the indicated subsections in Chapter 6 in the final EIS.

Section 6.3.10.1, Noise:

- The Applicants should construct noise barriers in all locations where the EJ&E arch crosses through or is adjacent to a natural area that has been identified in the DEIS as an area where birds are concentrated. These areas have been discussed previously and are identified in various places in the DEIS. The noise barriers should be constructed on the outside of the existing or proposed tracks (both sides) and the Applicants should review existing research that discusses the heights, shapes, and materials used to construct the barriers (e.g., use of absorbent material) in order to mitigate noise impacts to birds and wildlife. These should be designed in association with designated wildlife crossings to permit the safe crossing by wildlife. The Service can provide technical assistance in the noise barrier review. The Applicants should construct these barriers to keep the noise levels below 50 dBA in these areas. Noise barriers should also be discussed as a potential mitigation measure in section 6.3.11.2.

Section 6.3.11.3, Federally-Listed and State-Listed Threatened and Endangered Species:

- The Applicants should continue to abide by the special conditions of the 1996 COE Permit # 199600211 for train operations on the Paul Ales Branch in order to minimize further impacts to larval Hine's emerald dragonflies.

- The Applicants should conduct wetland delineations and habitat assessments in all construction areas to determine if suitable habitat is present for the eastern prairie fringed orchid. If suitable habitat is present, the Applicants should conduct orchid searches during the bloom date: June 28 through July 11, with searches conducted a minimum of three non-consecutive days within this time period.

- The Applicants should construct turtle ramps, drop boxes, or other structures that reduce the possibility of turtles becoming trapped within railroad rails, in all locations where the EJ&E arch crosses through or is adjacent to wetland areas. These structures should be placed at regular intervals in identified wetland areas. The Applicants should also construct turtle crossings in areas where turtles are concentrated (e.g., PWWFP). The Service can provide technical assistance in the selection and placement of these structures.

Section 6.3.14.6, Biological Resources:

- We agree with proposed Mitigation 30 concerning the Karner blue butterfly in the West Gary Recovery Unit. However, we do not agree with proposed Mitigation 57 concerning development and implementation of a plan for the restoration of dune and swale in the Ivanhoe connector area.

Based upon experience with attempts to recreate dune and swale habitat, we know that it has not been successful, even in areas not as heavily disturbed as the industrial property that would be affected by most of the connector. Therefore, we request that this proposed mitigation be deleted and replaced with mitigation to require the preservation and enhancement of the EJ&E prairie at the northwest end of the Kirk Yard. As previously mentioned, this area retains many natural qualities and is considered significant habitat for native plants and animals. It also supports wetlands, which likely need enhancement due to the encroachment of invasive species of plants and possibly animals. Therefore, it may be suitable to serve as required mitigation for the loss of wetlands at the Griffith connector, subject to approval by the regulatory agencies. Preservation of this prairie/wetland complex could be through a deed restriction and management agreement with the Indiana Division of Nature Preserves or through gift or sale to that agency.

- As discussed in our comments regarding section 3.3.1, we believe that a grade separation of the EJ&E over 5th Avenue or 5th Avenue over the EJ&E in Gary will likely be needed, resulting in impacts to the Ivanhoe dune and swale preserves. Mitigation measures to avoid, minimize, and offset any impacts need to be developed and included in the final EIS.

- The Applicants should avoid construction at PWWFP during the bird breeding season (April – August) to avoid disturbance of breeding birds in the vicinity.

- The Applicants should construct a hazardous materials containment system at PWWFP to capture hazardous materials in the event an accidental spill in this important wetland and bird habitat.

- We agree that Mitigation 62, concerning clearing of all equipment to reduce or prevent spread of invasive plant species, is necessary and desirable. However, the equipment would also need to be cleaned to remove invasive animal species, many of which are microscopic, such as veligers of invasive mussels that could spread into natural lakes and streams.

Section 6.3.14.7, Water Resources:

- The Applicants should conduct wetland delineations and associated habitat assessments to determine the floristic quality of wetlands that would be impacted by construction activities. The habitat assessments would be useful in determining the wetland mitigation replacement ratios, which could be higher than the 3:1 ratio noted in section 6.3.14.7.

- The Service believes that areas adjacent to the existing rail lines that currently support breeding grassland and wetland birds would become less suitable due to the increased number of trains and associated noise. We recommend that the Applicants consider conducting wetland and habitat restoration at one or more sites more remote from the rail lines to offset any reduced breeding bird productivity. There are a number of publically owned sites near the EJ&E arch that are currently undergoing habitat restoration or may be suitable candidates for restoration where impacts could be adequately offset. If this option is pursued, the Service could provide technical assistance in identifying potential sites.

Short-Term Use versus Long-Term Productivity of the Environment (Chapter 7)

In this chapter, SEA concludes that there would be some short-term construction disturbance which could have some impacts on resources. However, these would be eliminated upon completion of the construction activities. SEA also concludes that there would be no long-term impacts to resources. We disagree with SEA's conclusion that there would be no long-term impacts to resources and that short-term or long-term impacts would only result from disturbance associated with construction.

We believe that noise impacts to birds would be a long-term impact on birds. In addition, mortality of wildlife from train collisions and wildlife being trapped for longer periods between rails would also be long-term impacts. The final EIS should address these impacts on resources.

Section 7.2, Potential Hazardous Material Release: We disagree with SEA's conclusion that there would be no short or long-term impacts resulting from hazardous materials releases in the proposed construction areas. Due to the increased number of trains, the proposed action would create long-term impacts on resources (e.g., at PWWFP). The final EIS should address this issue more thoroughly.

Section 7.3.1, Wetlands: We agree with SEA's statement in section 7.3 that wetland productivity could be affected through permanent losses and adverse impacts to wetland function. However, section 7.3.1 states that long-term productivity would not be affected because the wetlands and wetland functions would be restored or replaced via mitigation. In addition, SEA states that wetlands and wetland functions would be protected by best management practices. We disagree with both conclusions.

Typically, wetland mitigation through section 404 of the Clean Water Act has focused on mitigating direct loss of habitat. However, we have suggested that increased noise would have a long-term impact on breeding bird productivity, which would not likely be considered during permit review, nor is it adequately considered in the DEIS. Offsite bird habitat restoration, as suggested previously in our comments, should be considered as a means of maintaining wetland bird productivity. Similarly, best management practices would offset some water quality and quantity impacts at the area of impact but would not address the impacts to wetland wildlife associated with increased rail noise. The final EIS should address these issues.

Irreversible and Irretrievable Commitments of Resources (Chapter 8)

Section 8.1.3, Protected Species: We disagree with SEA's conclusion that the proposed action would not irreversibly or irretrievably affect any particular animal populations. We believe that there would be ongoing impacts to wildlife that would not be fully mitigated with the mitigation measures presently proposed in the EIS. Our comments include recommendations that could improve the mitigation and lend support to SEA's conclusions.

Appendix M – Biological Resources Analysis

Section M.3.1, Natural Areas with Potential for Impacts: As noted previously, Middlefork Savanna Forest Preserve and MacArthur Woods Forest Preserve should be added to this section

and other applicable sections in the final EIS. Descriptions of these areas and the resources that could be affected should also be included in the final EIS.

For most of the natural areas listed in the section, SEA makes the same determinations that increased noise could only affect animal behavior within 500 feet of the rail line (and these animals already live with daily noise) and that the increased potential for animal/train collisions is not likely to adversely affect any particular animal populations. Again, we disagree with these conclusions. The language in the final EIS should be changed in this section to reflect our other requested changes listed throughout our comment letter.

Section M.3.1.1.9, Lake Renwick Forest Preserve: This section discusses the significance of the Lake Renwick Heron Rookery Nature Preserve. This section also acknowledges that flushing events from trains or train noise have been documented at the rookery. We do not agree with SEA's conclusion that there would not be a measurable impact on birds in the rookery from increased train noise. We also do not agree that SEA's determination that the increased potential for animal/train collisions would not likely adversely affect the rookery. The final EIS should address these issues.

Section M.3.1.1.14, Sauk Trail Woods and Indian Woods Forest Preserve: We disagree with SEA's determination that minimal impacts from increased noise and collisions on wildlife or habitat because this area is not being managed for wildlife or habitat. Just because a natural area is not being managed for wildlife or habitat does not mean wildlife is not present (and could be adversely affected). This language should be changed in the final EIS for this section and any other section for which this determination was made.

Table M.3.2-1, Natural Areas with No Impacts from the Proposed Action: We do not agree with SEA's inclusion in this section of natural areas that provide habitat for migratory birds and which are in close proximity to the EJ&E arch. The final EIS should address these issues.

SUMMARY COMMENTS

The DEIS provides general information on natural resources of concern to the Department, but detailed information and associated analysis is often lacking. Confusing information is presented about which agencies own or manage conservation lands in the two affected States and where conservation lands are located in relation to either the EJ&E or CN tracks. The DEIS inadequately identifies adverse impacts to the Service's trust resources (federally listed species and migratory birds) and does not fully disclose impacts to other wildlife. As a result, the DEIS inadequately identifies appropriate mitigation for these environmental impacts.

We offered numerous recommendations in these comments to address the aforementioned inadequacies of the environmental impact statement and thereby assist the SEA in fully disclosing and appropriately mitigating anticipated adverse environmental impacts.

The Department recommends that SEA coordinate with the appropriate Service field office(s) to discuss the concerns expressed and attempt to resolve the opposing views of the two agencies about anticipated project impacts to Service trust resources and mitigation needed to address the impacts. The results of the coordination, particularly any remaining differences of opinion, should be disclosed and adequately discussed in the final EIS.

The Department looks forward to continued coordination with SEA and the Applicants to ensure that project impacts to resources of concern to the Department are adequately addressed. For matters related to fish and wildlife resources and federally listed threatened and endangered species in the Illinois portion of the study area, please continue to coordinate with Mr. Shawn Cirton, U.S. Fish and Wildlife Service, 1250 South Grove Ave., Suite 103, Barrington, Illinois 60010, phone (847) 381-2253, extension 19, fax (847) 381-2285. For the Indiana portion of the study area, please continue to coordinate with Ms. Elizabeth McCloskey, P.O. Box 2616, Chesterton, Indiana 46304, phone (219) 983-9753, fax: 219-983-9816.

We appreciate the opportunity to review the document and provide comments.

Sincerely,

Michael T. Chezik

Mr. Jim Kvedaras
U.S. Public and Government Affairs
Canadian National
17641 S. Ashland Avenue
Homewood, Illinois 60430

Dear Mr. Kvedaras:

The U.S. Fish and Wildlife Service is responsible for leading protection and recovery efforts for federally endangered plants and animals in the United States. I want to let you know about an exciting conservation project in the lower Des Plaines River valley that hopes to secure the future for an animal listed as endangered under both federal and state law: the Hines emerald dragonfly. I believe Canadian National's participation is crucial to the success of this effort, and I hope to engage you as an active partner in a collaborative process that is already underway.

The Hine's emerald is currently only found in a few regions of the Midwestern United States. One of these regions includes the lower Des Plaines River Valley. Some of the wetlands within the Valley are considered important habitat for the dragonfly. These wetlands receive groundwater flows from adjacent upland areas. One of these important areas is along your railroad line that runs along the west side of New Avenue, and east of the Des Plaines River and the canals. We are specifically concerned about the stretch that is south of 135th Street in Romeoville, Illinois (*Learn more about the dragonfly in the Fact Sheet enclosed).* Our goal is to bring together a diverse group of stakeholders to work together to create a **Habitat Conservation Plan (HCP)** to help the dragonfly (*see the enclosed brochure about the HCP process*).

We have previously met on a few occasions with representatives from the Illinois Department of Transportation and the Environmental Law and Policy Center regarding the addition of Amtrack trains to the daily schedule on that rail line. We have also discussed with them the ongoing possibility of high speed rail service to St. Louis that would be on the same line. We are concerned about both the ongoing (existing) "take" of the Hine's emerald dragonfly from existing train operations on this line, as well as, increased "take" from new operations. It has come to our attention that there are several entities that operate trains on this line potentially contributing to the impacts to this listed species, Canadian National, Metra, Amtrack, and possibly BNSF. We

are endeavoring to bring all of the relevant railroad interests together to address this issue, but as the track owner CN's involvement is particularly essential.

Working together, we can create a future that helps each HCP partner's organization comply with federal and state law and co-exist successfully with protected species. Therefore, ***we invite you to join us*** in this creative and proactive problem-solving process. The intent is that both you and the dragonfly will benefit from your participation in this habitat conservation planning process.

The next meeting of the HCP team will be March 14, 2007 starting at 9am in the Bodine Community Room at the Romeoville Recreation Center located at 900 W Romeo Rd, Romeoville, Illinois 60446.

We invite you or someone from your staff to participate in that meeting. We would also like to meet with you and/or someone from your staff ahead of time, to provide you with more detailed background information and the anticipated role that Metra might have in the planning process. Please contact Mr. Jeff Mengler of my staff by phone at 847-381-2253, ext. 17 or by email at jeffrey_mengler@fws.gov, to arrange a meeting to discuss this further. You may also contact me directly at extension 11.

Thank you for considering our invitation and we look forward to hearing from you at your earliest convenience.

Sincerely,

John D. Rogner
Field Supervisor

Attachment B

Eastern Prairie Fringed Orchid Surveys

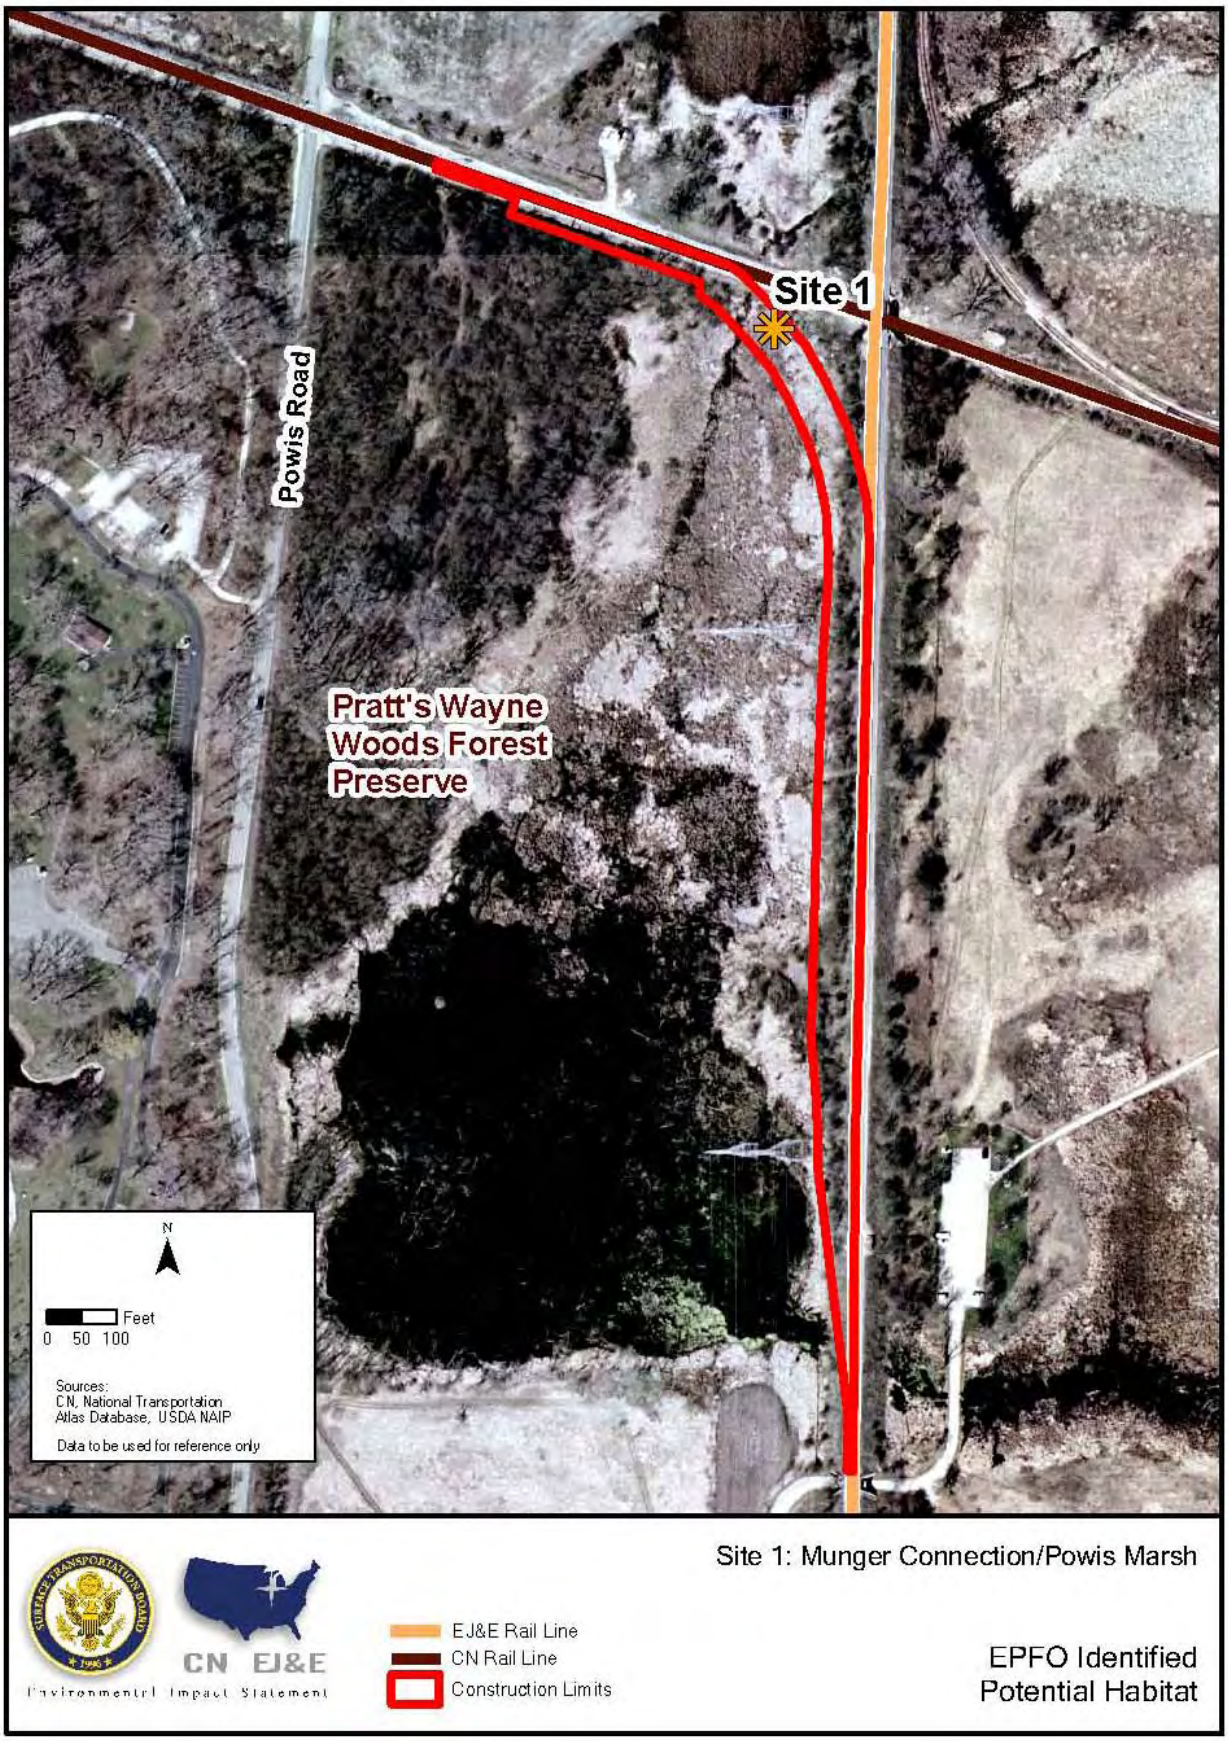
Attachment B - Eastern Prairie Fringed Orchid (EPFO) Habitat Surveys

HDR, Winzler and Kelly, CN and EJE site visits: October 28 and 30, 2008

In response to the comment letter submitted by the Department of Interior (DOI) on behalf of the USFWS, a meeting was requested with the Illinois and Indiana USFWS to resolve issues raised in their letter regarding the DEIS. The meeting was a continuation of the informal consultation process and resulted in a decision to carry out more detailed habitat assessments and additional analysis for the EPFO within construction areas of the project study area. Additional habitat surveys were conducted for suitable EPFO habitat within construction areas on October 28 and 30, 2008 by a multi-disciplinary team including HDR, W&K, EJ&E, and CN. Areas of remnant native vegetation, including marsh, sedge meadow, wet prairie, and mesic prairie sites were identified by HDR personnel during the survey. No attempt was made to identify areas of suitable habitat outside of proposed construction zones. HDR identified a total of six sites that appeared to include potential habitat suitable for the occurrence of the EPFO within proposed construction limits.

The Applicant has developed Voluntary Mitigation measures to address any potential impacts to EPFO individuals working in conjunction with the USFWS. One of these measures states:

> [Eastern prairie fringed orchid] Prior to any ground disturbing activities, Applicants shall hire a qualified biologist to survey for the Eastern prairie fringed orchid (*Platanthera leucophaea)* in areas containing suitable habitat. Applicants shall survey each area on at least three non-consecutive days between June 28 and July 11, as this is when the orchid typically flowers and is most identifiable. If the Applicants' biologist finds orchids, Applicants shall not conduct any construction activities in that area and Applicants shall notify USFWS and the Board immediately. The Board shall reinitiate consultation with USFWS. Applicants shall work with the Board and USFWS to determine appropriate measures to offset impacts, most likely providing funding for an ongoing hand pollination project, or providing funding to be used to enhance another orchid site (that is, brush cutting, prescribed burning).



The summaries below document the site conditions at the six locations HDR identified as potential EPFO habitat during the October 28 and 30th site visits.

Site 1: Pratt's Wayne Woods

Site 1 is located near the corner of the Munger connection within Powis Marsh.
Powis Marsh is located south of CN Segment 30A and West of EJ&E Segment 12. The marsh is dominated by invasive *Phalaris arundinacea* and *Typha* x *glauca* with scattered native species and areas of mixed native species dominated communities. Throughout the marsh, mixed willows and dogwoods are common in areas where open water is not present. A small area of native species dominated wet meadow was noted along the drainageway south of CN Segment 30A within Powis Marsh within the proposed construction limits of the Applicants revised, preferred alternative. This community is largely dominated by Lake Sedge (*Carex lacustris*) and Canada bluejoint (*Calamagrostis canadensis*) with heavy presence of invasive *Phalaris* and *Typha.*

Plants noted at Pratt's Wayne Woods Wet Meadow location during the October 28 site visit include:

#	**Species**	**% Composition**
1	*Asclepias incarnata*	2
2	*Aster praealtus*	2
3	*Boehmeria cylindrica*	4
4	*Calamagrostis canadensis*	20
5	*Carduus nutans*	2
6	*Carex lacustris*	10
7	*Carex spp.*	2
8	*Carex spp.*	3
9	*Conium maculatum*	1
10	*Cornus racemosa*	5
11	*Euthamia graminifolia*	4
12	*Helianthus tuberosus*	2
13	*Juncus torreyi*	1
14	*Pastinaca sativa*	1
15	*Phalaris arundinacea*	15
16	*Phragmites australis*	15
17	*Rhamnus cathartica*	2
18	*Rumex crispus*	3
19	*Salix exigua*	3
20	*Salix discolor*	2
21	*Salix nigra*	5
22	*Scirpus atrovirens*	5
23	*Solidago canadensis*	3
24	*Typha angustifolia*	10
25	*Verbena hastata*	2
26	*Zizea aurea*	2

Site 3- Naperville

Site 3 is comprised of a ditched area between Normantown Road and the EJ&E. Species composition along the EJ&E ditched area is dominated by Reed Canary Grass with mixed composition of native wet meadow species and non-native weedy species.

Plants noted within Site 3 during October 30 site visit include:

#	**Species**	**% Composition**
1	*Arctium minor*	5%
2	*Asparagus officinalis*	1%
3	*Calamagrostis Canadensis*	20%
4	*Iris virginica*	1%
5	*Phalaris arundinacea*	40%
6	*Phragmites australis*	2%
7	*Polygonum spp.*	5%
8	*Setaria glauca*	20%
9	*Typha angustifolia*	10%

Site 4 – Gougar Road, Unincorporated Will County

Site 4 is a mixed wet prairie/wet meadow, ditched area north of the EJ&E near Gougar Road in unincorporated Will County. New development is occurring both south of the EJ&E and northeast of this location along Gougar Road. This wet meadow is dominated by Canada bluejoint (*Calamagrostis canadensis*), big bluestem, sedge species and prairie cordgrass.

Additional plants noted within Site 4 during the October 30 site visit include:

#	**Species**	**% Composition**
1	*Ambrosia trifida*	15
2	*Andropogon gerardii*	25
3	*Aster pilosus*	5

EPFO Identified Potential Habitat

Site 5 – Schoolhouse Road

Site 5 is a mixed wet prairie/wet meadow, ditched area north of the EJ&E near South Schoolhouse Road in unincorporated Will County. This is a large site with some open water and wet prairie. Native grasses and sedges, including bluejoint grass and tussock sedge dominate the area along the EJ&E railroad embankment. Potential impacts could include fill along the northern edge of the rail embankment.

Plants noted in Site 5 during the October 30 site visit include:

#	**Species**	**% Composition**
1	*Asclepias incarnate*	2
2	*Asclepias syriaca*	2
3	*Calamagrostis canadensis*	50
4	*Polygonum spp.*	5
5	*Silphium terebinthinaceum*	2
6	*Salix nigra*	3
7	*Scirpus fluviatilis*	10
8	*Rumex crispus*	2
9	*Iris versicolor*	1
10	*Cornus racemosa*	2
11	*Helianthus tuberosus*	4
12	*Solidago gigantea*	3
13	*Solidago canadensis*	5
14	*Phragmites australis*	5
15	*Phalaris arundinacea*	10
16	*Spartina pectinata*	5
17	*Verbena hastata*	2

Potential Habitat

Site 6 – Matteson Illinois

Site 6 is located within the footprint of the Matteson connection along the eastern edge of the construction area, in a ditch north of the EJ&E tracks. The remainder of the construction areas of the Matteson connection were determined to be non-suitable habitat for the EPFO, and are characterized as wet forest, immature upland forest, turf grass, and pavement. Site 6 is characterized as a small linear wet meadow located at the base of the rail embankment in a small drainage way. Site 6 is dominated by invasive reed canary grass; however, the site contains a few conservative native species such as lake sedge, prairie cordgrass and Canada bluejoint grass. Hydrology appears to be influenced by local runoff from the railroad embankment, flowing into an unnamed tributary of Butterfield Creek.

Plants noted in Site 6 include:

#	**Species**	**% Composition**
1	*Phalaris arundinacea*	60
2	*Scirpus cyperinus*	5
3	*Calamagrostis canadensis*	5
4	*Carex lacustris*	2
5	*Scirpus fluviatalis*	2
6	*Phragmites australis*	10
7	*Juncus* sp.	20
8	*Carex stricta*	2
9	*Spartina pectinata*	1
10	*Fraxinus pennsylvanica*	5
11	*Acer saccharinum*	5
12	*Typha latifolia*	2
13	*Rhamnus cathartica*	10

EPFO Identified Potential Habitat

HDR/USFWS Site Visit: November 6, 2008

During the surveys conducted on October 28 and 30, HDR personnel observed numerous wetland delineation flags in wetland sites within some of the proposed construction areas. CN confirmed that growing season wetland delineations had been conducted by Hey and Associates for the majority of the construction areas in 2008. CN supplied this information to HDR on November 5th, 2008 for review and use in our additional analysis. Table 1 below summarizes the information contained within the five wetland reports.

Typically the USFWS requests a Floristic Quality Assessment (FQA) to determine if a project site contains suitable habitat for the EPFO. Floristic Quality Assessments are conducted during the growing season to document all plant species within a particular site and determine its quality. From the plant data collected, each site is given an FQA score called an FQI. The USFWS looks at the FQI score and the mean C value (a measure of the coefficient of conservatism) to make determinations on the potential for EPFO to occur within mesic prairie, wet prairie, and sedge meadow habitats.

An additional site survey was conducted on November 6th by HDR and USFWS to observe the six habitat areas identified within two sites.

The Matteson connection (Site 6) was the first site visited by HDR and USFWS on November 6th. The Service determined most of the construction area was not habitat for the EPFO; however, not all areas within the construction foot print could be ruled out as EPFO. A small sedge meadow community was identified on the eastern edge of the construction area in a ditch north of the EJ&E tracks. Because this area did not have a growing season plant survey or an FQI score, we recommend this area be surveyed according to the methods outlined below, prior to any construction activities.

The next site visited on the November 6th site survey was located in an area of double tracking just west of South Schoolhouse Road (Site 5) in unincorporated Will County. This site consisted of a wet prairie/wet meadow north of the EJ&E. Native grasses and sedges dominated this wetland site and the Service agreed it would definitely be classified as potential EPFO habitat. Because this area did not have a growing season plant survey or an FQI score, we recommend this area be surveyed according to the methods outlined below, prior to any construction activities. CN may take the avoidance approach and construct a small retaining wall to contain fill.

The third site visited was located north of the EJ&E immediately west of Gougar Road (Site 4). This wet prairie site is located in an area of double tracking , however, during the site meeting it was determined that the available right of way within the footprint of the existing embankment was sufficient to support the new double tracking without impacting the adjacent wetlands. If this is the case, no additional habitat surveys will be needed within this site. However, if this site cannot be avoided, we recommend this area be surveyed according to the methods outlined below, prior to any construction activities.

The fourth site was located north of the EJ&E, west of Wolf's Crossing Road (Site 3). This wetland was in an area where CN had completed wetland delineations. The site, identified in the CN delineation report as Wetland 14, maintained an FQI of 14.1 and a mean C value of 3.4. The Service indicated this site is likely not habitat for the EPFO, however, because the site had a mean C of 3.4, a closer look at the species present within the wetland would likely be required before the USFWS can determine if suitable habitat for the EPFO exists.

The fifth site (Site 2) identified by HDR was not visited by the USFWS on November 6th, 2008, because of time constraints. The service chose to skip this site based on the fact that this wetland site had been delineated and a growing season FQI was performed. The site, identified in the CN delineation report as Wetland 12, maintained an FQI of 12.1 and a mean C value of 3.1. Because the site had a mean C of 3.1, a closer look at the species present within the wetland would likely be required before the USFWS can determine if suitable habitat for the EPFO exists.

The final site visited during the November 6th field visit was the connection at Munger (Site 1). This wetland was in an area where CN had completed wetland delineations. Based on an FQI score of 24, and a mean C value of 3.2, the Service agreed that this area would require an orchid survey.

EPFO Habitat Surveys

The Applicant (CN) shall perform a Floristic Quality Assessment (FQA) in all wetland and mesic prairie locations within areas of proposed construction of double track or new or improved connections. FQAs are required to be conducted during the growing season (generally: May 1-October 1). FQA data will be submitted to the USFWS to identify if habitat suitable for the orchid is present in the locations of proposed Transaction-related construction of double track or new or improved connections. If suitable habitat is identified by the USFWS Service Orchid surveys will be required. Orchid surveys should be conducted during the bloom period from June 28 through July 11, with searches conducted on a minimum of three non-consecutive days within this time period.

CN may already have much of the data the USFWS needs to make a determination; however, it is recommended that CN submit this information to the USFWS for their determination under their own cover letter.

Barrington, IL 60010

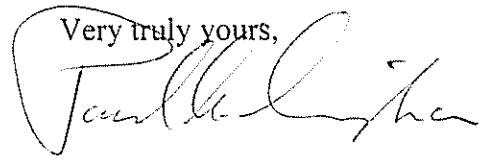
Re: ***Canadian National Railway Company and Grand Trunk Corporation – Control – EJ&E West Company*** **(STB Finance Docket No. 35087)**

Dear Messrs. Rogner and Cirton:

I have been informed by the Section of Environmental Analysis ("SEA") of the Surface Transportation Board ("STB") and by SEA's third-party consultant in the above-captioned proceeding, HDR Engineering, Inc. ("HDR"), that Midwest Generation, LLC ("MWG"), has suggested to the U.S. Fish and Wildlife Service ("USFWS") that the transaction proposed in this proceeding could require MWG to seek to construct additional rail storage capacity near its Will County Generating Station, in Romeoville, Illinois. As we understand from SEA and HDR, your office has expressed concern that construction of that capacity, which could have adverse impacts on the habitat of the Hines emerald dragonfly ("HED"), would therefore be an indirect effect of the proposed transaction.



Because it appears that USFWS may not have been provided with a complete explanation of the situation regarding storage of coal trains for MWG, changes in that situation that would result from the proposed transaction, and effects of those changes on the HED and its habitat, we have prepared the enclosed paper summarizing those facts, and explaining why, contrary to the

suggestion apparently raised by MWG, adverse impacts on the HED are not likely as a result of the proposed transaction. We believe that you will find this paper helpful in preparation for the conference call scheduled for this Friday, November 7, 2008, at 2:00 p.m. Central Time to discuss issues related to MWG.

The enclosed paper describes voluntary mitigation conditions which CN would be willing for the STB to impose on its approval of the proposed transaction, in order to ensure that the transaction would have no adverse impacts on the HED. For your convenience, I have also enclosed a list setting forth language of specific conditions that CN is considering submitting to SEA to mitigate potential impacts of coal delivery to MWG, and to address several other issues (regarding migratory birds, rare and listed turtles, Karner blue butterfly, and Indiana dune and swale) that were raised at the October 23 meeting.[1] I would appreciate it if you would review those draft conditions and let me know whether they would adequately address USFWS's concerns, so that we may decide whether to propose them to SEA as conditions that CN would consent to have imposed on it in any STB decision approving the transaction.

I look forward to hearing from you.

Very truly yours,

Paul A. Cunningham

Enclosures

[1] Two separate habitat assessments (April and October 2008) have been conducted, in cooperation with the USFWS, The Nature Conservancy ("TNC"), and representatives of the Indiana Department of Natural Resources (IDNR), at Kirk Yard as well as at the locations of proposed Transaction-related construction of double-track and new or improved connections, to identify potential voluntary mitigation measures. The enclosed list reflects the findings of those habitat assessments.

STORAGE OF COAL TRAINS BY MIDWEST GENERATION LLC
ON TRACKS OF ELGIN, JOLIET AND EASTERN RAILROAD COMPANY

Coal Trains Destined for MWG Plants Are Currently Staged on EJ&E Property, Under an Informal, Non-Binding Arrangement Between the Parties

Midwest Generation, LLC ("MWG"), operates two coal-burning electric power plants in the Joliet area: the Joliet Generating Station, including units on both sides of the Des Plaines River south of Joliet, and the Will County Generating Station, located in Romeoville, at the end of the Paul Ales Branch (also known as the Romeoville Branch) of Elgin, Joliet and Eastern Railroad Company ("EJ&E"). Union Pacific Railroad Company ("UP") originates coal in the Powder River Basin ("PRB") which it delivers to the Joliet Station by means of haulage rights over EJ&E between West Chicago and the plant. UP interchanges PRB-originated coal with EJ&E at West Chicago for delivery by EJ&E to Will County Station.

Currently, MWG can hold two coal trains (one loaded and one empty) on tracks at the Romeoville Yard, located on the Paul Ales Branch near Will County Station, and two coal trains (one loaded and one empty) at the Joliet Station. If coal trains are delivered by UP in bunches, rather than coming at even intervals, they must be held at locations some distance away from the MWG plants. Accordingly, for the convenience of UP and MWG, EJ&E currently permits those trains to be staged at three locations on EJ&E's property when those locations are not otherwise in use – Normantown siding (ca. MP 14.5- ca. MP16), Turner siding (ca. MP 2-ca. MP5.5), and at East Joliet Yard – while awaiting delivery to Joliet and Will County Stations. To the best of EJ&E's knowledge and belief (determined after a search of EJ&E's records[1]), EJ&E has no formal agreement with MWG that obligates it to permit these trains to be stored on its property; at most, there is an informal arrangement between the parties that EJ&E has the right to terminate at any time.

The Proposed CN/EJ&EW Transaction Would Place CN in the Same Position EJ&E Now Stands; CN Has Made No Decision to Terminate EJ&E's Current Informal Arrangements with MWG

The transaction proposed in CN's application to the Surface Transportation Board ("STB") calls for EJ&E to transfer most of its rail assets to a subsidiary, EJ&E West Company ("EJ&EW"), and for CN to acquire control of EJ&EW through purchase of all of EJ&EW's stock. As a result of that transaction, CN would step into the shoes of EJ&E with respect to any arrangement EJ&E now has with MWG. Thus, CN would have the same right that EJ&E now has to decide, on a case-by-case basis, whether to store

[1] E-mail from James H. Danzl (General Manager Marketing and Raw Material Transportation, EJ&E) to Gordon T. Trafton (Senior Vice-President, Southern Region, CN) (Nov. 4, 2008, 08:20 a.m. CST) (copy attached).

undeliverable MWG trains and to unilaterally terminate any informal arrangements under which EJ&E coal trains are staged on the EJ&E yard and sidings.

Although CN representatives informed MWG representatives, at a meeting held August 7, 2008, that it is not CN's normal business practice to store customers' trains on its property, CN has never represented to MWG, at the August 7 meeting or otherwise, that it would terminate the informal arrangements under which MWG stages trains on EJ&E property, nor has it made any decision to do so. Nevertheless, MWG has categorically asserted that "should the CN acquire the EJ&E, we will lose all three of our train 'landing spots' for Will County Station"[2] and has made representations to USFWS that "unless we expand our track storage capability within the 5 miles of our track, we will not have a sufficient coal supply to sustain operating of our three generating facilities which rely on this rail line for fuel."[3] Accordingly, MWG has approached USFWS to discuss MWG's plans to provide storage space for additional coal trains by "increase[ing] the number of rail sidings/lines within the River South area" on the Paul Ales Branch that has "heretofore been considered 'off-limits', due to heightened environmental concerns."[4]

Construction of MWG's Proposed Sidings Is Not an Effect of the CN/EJ&EW Transaction

Because the proposed new sidings would be located in the environmentally sensitive habitat of the Hine's emerald dragonfly ("HED"), USFWS suggests that it may not be able to concur that STB approval of the proposed CN/EJ&EW transaction "is not likely to adversely affect [the HED] or critical habitat," 50 C.F.R. §§ 402.13(a), 402.15(b)(1), because the effects of the construction of those sidings would be indirect effects of that transaction.

Under USFWS regulations, however, indirect effects of a proposed action "are those that are caused by the proposed action and are later in time, but still are reasonably certain to occur." 50 C.F.R. § 402.02. There is, however, no certainty that the construction of the sidings would be necessary, much less occur, if CN were to acquire control of EJ&EW (and with it EJ&E's present lines).

MWG's position, as we understand it, is that, because coal trains may be delivered by UP at times when MWG's existing storage capacity is filled, if no space is available on the EJ&E lines to hold those trains, MWG will have no choice but to create additional storage locations on its own property, which necessarily will adversely affect

[2] E-mail from Julia Wozniak (Environmental Program Manager, Midwest Generation Environment Services) to Shawn Cirton (Fish and Wildlife Biologist, U.S. Fish and Wildlife Service ("USFWS") (Oct. 29, 2008, 09:20 a.m.).

[3] E-mail from Julia Wozniak to Jeffrey Mengler (Botanist/Wetland Ecologist, Chicago Illinois Field Office, USFWS) (Oct. 23, 2008, 03:16 p.m.).

[4] *Id.*

the HED and its habitat. This is not the case. First of all, as noted above, no decision has been made by CN to terminate the informal arrangements under which MWG coal trains have been staged on EJ&E property. In addition, CN has not yet begun to examine the range of possible alternatives to Normantown and Turner sidings and to the East Joliet Yard that might be available for staging MWG trains. CN stands ready, however, to cooperate with MWG in an effort to identify alternative locations on CN property, or available to CN, on which loaded coal trains could be staged while awaiting delivery to MWG's plants and which would make unnecessary even the contemplation of any construction of additional train storage capacity on MWG property that would adversely affect the Hine's emerald dragonfly or its habitat. If no adequate existing train storage locations could be identified, CN would make reasonable efforts to acquire or construct, at MWG's expense, new train storage capacity, at locations where construction would not have adverse impacts on the Hine's emerald dragonfly or its habitat, and which would make construction of additional storage capacity on MWG's property unnecessary, and would make that capacity available as needed for staging of coal trains destined for Will County and Joliet Stations. CN is willing for the STB to condition its approval of the proposed CN/EJ&EW transaction on a requirement that CN make these efforts to identify and provide storage space for MWG trains.

Moreover, CN can ensure that there will be no need for MWG to construct additional train storage space on its environmentally sensitive property by committing that it will work with UP (or other railroads that may forward coal trains for delivery to MWG) to meter coal trains to assure that they do not come upon the EJ&E line unless there is sufficient storage capacity, and that its dispatchers will not permit coal trains to move onto the EJ&E line from the other railroads' lines unless CN has confirmed that space will be available on MWG's existing tracks, or on available facilities on the EJ&E line, to receive those trains. CN is willing to have this commitment imposed by the STB as a condition of its approval of the proposed transaction.

Given CN's willingness to make these commitments, there is no ground for believing that the CN/EJ&EW transaction would adversely affect the HED or its habitat. But there is a further reason that construction of MWG's proposed sidings, and consequent impacts on the HED, cannot be considered "reasonably certain to occur." CN understands that MWG has been seeking authority to construct additional sidings on the Paul Ales Branch for several years.[5] The fact that MWG has been unsuccessful for so long indicates that obtaining that authority is far from "reasonably certain."

CN understands, on the basis of discussions with Ken Mierzwa, Senior Scientist with the consulting firm of Winsler & Kelly,[6] that construction of additional sidings on the Paul Ales Branch is likely to destroy so much of the HED habitat remaining in

[5] MWG's Julia Wozniak alludes to these efforts in her e-mail message of October 23, 2008, to USFWS's Jeffrey Mengler.

[6] Winsler & Kelly is a subcontractor to HDR Engineering, Inc., the third-party consultant retained by the STB's Section of Environmental Analysis to assist it in preparing the Environmental Impact Statement for the CN/EJ&EW transaction.

northeast Illinois as to significantly threaten the continued existence of the species in Illinois. This level of harm would appear to constitute a "take" under the Endangered Species Act, and would accordingly require a permit from the USFWS before any action could be taken. *See* 16 U.S.C. §§ 1532(19), 1538(a)(1)(B), 1539(a)(1). The likelihood of obtaining such a permit appears remote, especially in light of the potentially devastating impacts of the construction on the remaining HED habitat. Moreover, it appears that construction of the proposed additional sidings would require wetlands permitting from the U.S. Army Corps of Engineers, which apparently has not hitherto been forthcoming.[7]

It thus appears that construction of the additional sidings would only occur if necessary permission were granted, not only by USFWS itself, but perhaps also by the Corps of Engineers. USFWS cannot reasonably conclude that either it or the Corps is more likely to grant that permission now than it has been in the past, or that the resulting construction impacts are now more "reasonably certain to occur" than they were previously.[8]

In any event, CN has previously declared its willingness to discuss with USFWS the possibility of contributing to the development of a Habitat Conservation Plan for the HED (though without prematurely conceding any need for CN to seek a USFWS permit for itself).[9] That willingness is consistent with CN's consent, described above, to imposition of a condition that would require it to commit to cooperate with MWG in examining alternative storage options, including if necessary construction of new storage for the use of MWG coal trains. USFWS should therefore conclude that adverse impacts on the HED are not likely, both because it is not reasonably certain that MWG could obtain the permits necessary for construction of sidings on MWG property, and because CN stands ready to take steps that would foreclose the need for any such construction and that would not adversely affect the HED.

[7] Again, Ms. Wozniak's message to Mr. Mengler alludes to the need to obtain "work closely with . . . the U.S. Army Corps, if necessary, to ensure that appropriate measures are taken to continue to protect and enhance HED habitat."

[8] Even if MWG were to claim that it now has greater need for such authority, USFWS could not reasonably rely on that as grounds for granting a permit under the Endangered Species Act, as the impacts of the construction on the HED do not change because of a change in MWG's circumstances. If USFWS were to take those circumstances into account in determining whether to grant a permit, it would, in effect, be weighing MWG's need to construct additional sidings to permit efficient operation of its plants against CN's need to consummate the CN/EJ&EW transaction to permit efficient operation of its system in and through Chicago. We assume that USFWS recognizes that nothing in the Endangered Species Act requires or authorizes USFWS to mediate between business interests in such way, especially if its choice would be to favor the business that would be directly causing harm to listed species rather than the one whose impact would be, at most, indirect and attenuated.

[9] Letter from Paul A. Cunningham (Counsel for CN) to John D. Rogner (Field Supervisor, Chicago Ecological Services Field Office, USFWS) and Shawn Cirton at 4 (Oct. 23, 2008).

Subject: Midwest Generation

Gordon:

Regarding your questions on whether or not EJE has a commitment to hold trains short of Midwest Generation's Will County plant. we have conducted a thorough search of our files in Marketing to determine if a commitment actually exists. None of the formal documents(the original Transportation Contract and all amendments, the Spur Track Agreement and Bill of Sale Agreement), between the EJE have any commitment by EJE to hold trains short of Midwest Generation's plants.

In the development of this project and at a meeting with Commonwealth Edison (now Midwest Generation), EJE operations did indicate that the EJE could hold two trains in front of Midwest Generation-one at West Chicago and the other between West Chicago to and including Joliet Yard. To my knowledge there was never any written commitment which bound EJE to this statement on how EJE could or would operate. The meeting was held on February 13, 1997 and was attend by Mr. M. Turner-GM EJE, Mr. C. Curran-Supt Transportation EJE, Mr. J. Jamrus-Account Manager EJE, a host of Commonwealth Edison people-both plant and headquarters including Larry Siler and several UPRR Operating and Marketing representatives.

My read of this Gordon is that we explained how we intended to operate (or react) should the bunching of trains occur or a sudden spike in coal demand occur, but at no time did EJE ever commit in writing to a long term obligation to hold or store trains. I believe a question was asked on what would happen if multiple trains arrived in Chicago, the answer was that EJE could hold two train sets. Again, I do not and did not see this as a commitment-either short or long term.

Hope this answers your questions.

Jim

Midwest Generation Coal Storage Capacity

I. Introduction

During the preparation of this Report, an issue emerged relating to one of the customers of the EJ&E. The customer, Midwest Generation (MGen), raised the issue of coal storage at its Will County electric generating facility at Romeoville. MGen has an arrangement with the EJ&E where coal trains are held on sidings on the EJ&E until MGen is ready to unload the trains. According to CN, there is no written agreement to support this arrangement. MGen is concerned that the Proposed Action will remove the holding areas and limit MGen's flexibility. MGen believes it may need to expand its rail yard at Romeoville to regain lost flexibility. Expansion of the Romeo yard (MGen's proposal) would most likely have an adverse effect on the Hine's Emerald Dragonfly (HED).

SEA has characterized the issue of MGen's storage capacity as unrelated to the Proposed Action. Before MGen could ever expand its Romeo yard, it would need a Section 404 permit from the Army Corps of Engineers, Chicago District which would require consultation with the U.S. Fish & Wildlife Service (FWS). SEA believes that the process for issuance of such a permit would involve the evaluation of alternatives which would, most likely, show that the rail yard expansion was not needed. SEA believes that MGen's need to expand its yard is not an indirect or cumulative effect of the Proposed Action under the Council on Environmental Quality (CEQ) regulations that govern compliance with the National Environmental Policy Act (NEPA) and the Interagency Cooperation regulations that govern consultation under Section 7 of the Endangered Species Act (ESA).

FWS has characterized the issue of MGen's storage capacity limitations as closely related to the Proposed Action. FWS would prefer not to postpone the consideration of this issue until a Section 404 permit is needed if postponement would limit the range of alternatives. FWS believes the expansion of the Romeo yard may be reasonably foreseeable and could be an indirect and cumulative effect of the Proposed Action under NEPA and ESA.

This Report will present information on the rail operations that surround this issue, the statutes and regulations that govern STB's and FWS's decisions on this issue, and make recommendations on the proper resolution of the issue.

II. Background-Rail Delivery

A reliable coal supply to MGen's Will County Generating Station located in Romeoville, Illinois is strongly dependent on a reliable rail delivery network. This facility supplies coal not only to the Will County Generating Station but also supplies coal through a rail-barge transfer to MGen's Fisk and Crawford Generating Stations, both located in Chicago, Illinois.

The three power plants obtain 100% of their coal from the Southern Powder River Basin (PRB) in Wyoming. All three plants were originally designed to use Illinois Basin coal and switched to the PRB for coal supply approximately in 1995. All three plants are "merchant plants" selling generated capacity to transmission companies. The three plants were originally Commonwealth Edison plants. Illinois Basin coal was delivered both by barge (via the rail-to-water transfer at Havana, Illinois) to all three plants and by rail to Will County. Rail service, if it existed previously to the Fisk and Crawford facility, apparently no longer exists at these two locations.

Current consumption of the three plants is approximately a total of 6 million tons per year. Approximately 3 million tons/year is consumed by Will County, and 3 million by Fisk and Crawford. Storage for all three plants is primarily at Will County. Crawford has a very small storage capability. Fisk has no storage capability and barges serve as its live coal supply. MGen expects to consume 6.2 million tons at the three plants in 2008 and plans to consume 6.2 million tons in 2009 compared to 6.1 million tons in 2007 and 6.2 million tons in 2006. Current planned total coal consumption is approximately 20,500 tons/day at a 70% capacity factor. MGen indicated that it is a merchant generating company, and that it is in their best interest to maximize the generation from their coal

plants. MGen stated it tries to keep 40 days of coal inventory on hand and that it does not know of any regulatory limits on maximum or minimum inventory size.

MGen also receives PRB coal by rail to its Waukegan Generating Station north of Chicago (served UP direct or UP-EJ&E) and to its Powerton Generating Station in central Illinois, served UP-Illinois Midland Railway.

Union Pacific holds the contract with MGen for coal delivery through 2011. Union Pacific handles 50-60% of all coal trains generated daily out of the PRB with BNSF handling the balance. Most of this coal (400 million tons mined and shipped in 2007) moved east and south from the PRB. Typically, UP loads 35 to 36 trains and repositions the same number of empty coal trains returning to the PRB each day. These seventy trains are added to another 70 to 80 trains that operate daily on the UP mainline through Wyoming and Nebraska. To handle this volume, UP has constructed a three-track mainline that is at capacity. Discussions are underway to potentially add a fourth main track at congested locations. To handle this ever increasing volume, UP is also expending capital dollars on increasing capacity on the Sunset Route through southern tier states. In addition to physical plant improvements, both BNSF and UP are modifying their operating practices by operating longer and heavier trains in order to increase "slot utilization:". In other words, if main track capacity is constrained, one method of improving throughput is to have each train handle more. What is driving these railroads to handle longer and heavier trains is the fact that UP and BNSF shipping rates are not regulated except by the market and it is therefore incumbent on each railroad to operate as efficiently as possible. These trains were 100 to 115 cars in length only a few years ago but developments in the reliability of remotely controlling locomotives (labeled Distributed Power) placed throughout the train to ensure better train handling characteristics enable the western railroads to begin 135 car operations. Trains 150 cars in length are now seriously being considered.

UP delivers loaded coal trains to EJ&E at West Chicago. EJ&E is a handling-line carrier from West Chicago to Romeoville via the Paul Ales Branch, which connects to the EJ&E main line near Joliet. The branch line connection opens only to the south, requiring arriving loaded coal trains moving south from West Chicago toward Joliet to pass the Paul Ales Branch connection, enter Joliet Yard, reverse direction, then return northward and enter the branch line. MGen was uncertain whether departing empty trains also enter Joliet Yard before reversing direction northward on the EJ&E main line. Arriving trains travel northward on the Paul Ales Branch to the Romeo Yard approximately one mile prior to the end of the branch. The yard consists of two through tracks of 118-car capacity on the east side of the main track (Romeo 1 and 2), and one through track of 40-car capacity on the west side of the main track (Romeo 3 and 4), subdivided into two 20-car tracks by a universal crossover connecting to the main track.

UP delivers the coal trains as 135 car trains with Distributed Power, using 2 A.C.-type locomotives on the head end and one on the rear. Typically, EJ&E will move the head-end locomotives to the rear of the train in East Joliet Yard when they prepare to reverse the train onto the Paul Ales Branch. Usually EJ&E removes the UP locomotives from the arriving inbound trains and returns with UP locomotives when the trains are made empty. Prior to 2004 coal trains were 115 cars long. The trains increased to 135 cars that year. MGen has prepared conceptual engineering drawings for enlarging the Romeo Yard to accept 150 car trains by extending Romeo Track 1, 2, and 4 in a southward compass direction. MGen currently attempts to limit train operations at the south end of the yard (starting 22 cars from the south end) per agreement with U.S. Fish & Wildlife Service as they are aware that this is one of the locations identified as critical habitat for the HED.

EJ&E crews are prohibited from proceeding past the dual use bridge located just north of the Romeo Yard. EJ&E crews deliver a loaded train to Romeo Track 1 or 2, then move whatever doesn't fit into these tracks (usually 20 cars) over to Romeo Track 3 or 4. After the loaded train is delivered, MGen uses a switch engine (under contract to MGen) to pull 40 car cuts to its rotary dumper. The loaded cars are pulled into the dumper bypass track, then split in half. The first 20 cars are pulled past the dumper, then pushed through the dumper and emptied. The switch engine then pulls the second 20 cars past the dumper, shoves through the dumper pit onto the first 20 empties, and when all are empty pushes the 40

cars back to Romeo Yard and returns with a second 40 cars, and so forth until the train is made empty. MGen states it usually takes 10-12 hours to empty a train, barring mechanical problems with the dumper or associated coal handling machinery. MGen has two switch engines, both SD9 (six-axle, 1,750 hp, D.C.) type. One engine is essentially a spare, and MGen rarely uses both at once. MGen is staffed to dump trains around the clock, 365 days a year. The dumper nameplate capacity is 4,000 tons per hour. The dumper was installed in 1996.

MGen notifies EJ&E approximately two hours before it expects to have a train emptied. EJ&E sends car department personnel to connect the air hoses for the train's braking system and inspect the train. Romeo Yard is equipped with a yard-air compressor which is then attached to the assembled train in order to expedite train departure. EJ&E train crews return with UP locomotives and depart. Bad-order cars that cannot be repaired on site are set out and removed by an EJ&E local train to either the East Joliet yard or Kirk yard in Gary for repair.

Normal train operation provides for a loaded train to be emptied and departed before the next loaded train arrives. At times there will be two trains at the Romeo Yard simultaneously. MGen stated it can completely dump one train and 80 cars of a second train before it runs out of space for empties and must await EJ&E to depart an empty train. EJ&E uses the Crest Hill Siding north of the Paul Ales Branch and other sidings such as the siding at Normantown on the EJ&E rail line to stage inbound loaded trains if they arrive bunched and overtax the capacity of the Romeo Yard and the dumper operation.

MGen has 4,000 cars in its fleet. All are 286K, aluminum, rotary-dump type.

MGen normally has 8 to 9 trains in the cycle between the Southern PRB and Will County; at times up to 11 depending upon coal demand and cycle-time fluctuations. MGen can divert trains to Waukegan or Powerton from Will County, or vice versa, depending on demand, inventory, and railroad traffic conditions. MGen uses the KCBX Rail-to-Water transfer at Calumet Harbor in Chicago as an alternative to direct rail delivery to Will County as required by rail delivery delays on the EJ&E or plant mechanical or dumping interruptions at Will County. Coal dumped at KCBX is moved by barge to Fisk and Crawford. Will County at present does not have capability to transfer coal from barge to its inventory as the barge unloaders previously used at Will County have been decommissioned. MGen stated it prefers not to divert trains to KCBX due to the greater cost necessary to use the KCBX facility and the additional cost for the longer barge movement and greater required barge inventory from KCBX to Fisk and Crawford. Midwest stated in 2007 it diverted 12 trains to KCBX, and to date in 2008 has diverted 40 trains. Delivery of 6.2 million tons/year to Will County requires an average of 1.3 trains received daily at Will County, or an average of approximately 9 per week. MGen stated at present it is receiving only an average of 7 trains per week at Will County, with the remaining trains diverted to KCBX.

MGen states it believes it owns the track materials on the Paul Ales Branch, and maintains the track to the junction with the EJ&E main track, while the underlying land continues to be owned by Commonwealth Edison. MGen holds a use license from Commonwealth Edison.

MGen stated that service problems are at present occurring mostly on the EJ&E. While there are issues on UP, MGen's concern is EJ&E's capability to handle the trains effectively. MGen states it communicates constantly with both UP and EJ&E to track train movements and schedule trains at its receiving facilities. MGen stated that it perceives the issues with EJ&E center on lack of crews. Often crews run out of Hours of Service while still at Romeo Yard with empty trains, or EJ&E does not have rested crews to take trains from UP at West Chicago all the way to Romeo Yard and deliver. MGen stated that the sidings on EJ&E are useful to it to stage inbound trains to work around dumping capacity at Will County. MGen is concerned that if the sidings are converted into second main track as a result of the CN-EJ&E merger that it will no longer have the ability to stage trains close to Will County. MGen is concerned this trend will result in greater diversions to KCBX. MGen stated it had discussions with CN about post-merger service levels and that CN listened to MGen concerns and

stated it had no solutions other than possibly using Glenn Yard as an overflow or staging point. MGen stated a related problem is a six-hour daily curfew due to the Metra trains at West Chicago.

CN sent a letter dated November 6, 2008 addressing MGen's issue. The letter stated that CN was proposing two voluntary mitigation conditions for consideration by FWS and SEA that CN believed would resolved MGen's issue. The first proposed voluntary mitigation condition stated that CN would commit to work with MGen to identify sites either on CN's property, or available to CN, that would provide for storage of coal trains headed for the Will County facility. If no sites can be found, additional storage capacity could be built at MGen's expense. Whether an existing site is designated or a new one built, there would be no need for MGen to expand its Romeo yard. The second voluntary mitigation measure stated that CN would agree not to accept coal trains from UP unless it had available capacity to deliver the trains to MGen in a timely fashion.

III. Statutory Bases for Decisions

A. Interstate Commerce Commission Termination Act

STB is required to issue a certificate authorizing the acquisition of a railroad unless STB finds the application is inconsistent with the public interest. The certificate may require compliance with conditions STB finds necessary in the public interest (49 USC 10901(c)).

B. National Environmental Policy Act

Federal agencies such as STB are required to prepare an environmental impact statement (EIS) to accompany each major Federal action which significantly affects the quality of the human environment. (42 USC 4322(2)(c)). On November 23, 2007 STB issued a Decision effective November 26, 2007 which stated that STB would prepare an EIS for this transaction. On December 21, 2007, SEA issued a Notice of Intent to Prepare an EIS.

C. Endangered Species Act

Each Federal agency such as STB shall, in consultation with the Secretary of the Interior, insure that any action authorized by such agency is not likely to jeopardize the continued existence of any endangered species or result in the adverse modification of critical habitat of such species. (16 USC 1536(a)(2)).

IV. Administrative Standards and Procedures

A. SEA Regulations

SEA regulations (49 CFR 1105.7(d)) state the required content of any environmental report, including an EIS, that is prepared as part of a proceeding before STB. The regulations provide in part as follows:

> (2) *Transportation System.* Describe the effects of the proposed action on regional or local transportation systems and patterns. Estimate the amount of traffic (passenger or freight) that will be diverted to other transportation systems or modes as a result of the proposed action.
>
> (8) *Biological Resources.* (i) Based on consultation with the U.S. Fish and Wildlife Service, state whether the proposed action is likely to adversely affect endangered species or areas designated as critical habitat, and if so, describe the effects.
>
> (ii) State whether wildlife sanctuaries or refuges, National or State parks or forests will be affected, and describe any effects.

(11) *Additional Information for Rail Constructions*. The following additional information should be included for rail construction proposals (including connecting track construction):

(v) Describe the effects , including indirect or down-line impacts, of the new or diverted traffic over the line if the thresholds governing noise, energy, noise and air impacts in Sections 1105.7(e)(4), (5), or (6) are met.

B. Relationship of SEA Process to STB Decisions

On November 23, 2007 STB issued a Decision effective November 26, 2007 which accepted CN's application, classified the proposed transaction as minor under 49 CFR 1108.2(c), and established a procedural schedule. STB stated that any person who wished to participate as a Party of Record on the merits side of the transaction needed to file a notice of intent to participate no later than December 13, 2007 and written materials no later than January 28, 2008.

On December 12, 2007 STB issued press release No. 07-42 with guidance for the public on participation in the economic and environmental analyses for this transaction. The press release indicated that if a person's interests are focused on potential impacts on environmental issues, then the appropriate forum is SEA's environmental process. The press release pointed out that filings addressing the competitive and economic aspects of the proposed transaction must be filed in accordance with the STB Decision which was effective on November 26, 2007.

On July 24, 2008 STB issued a Decision effective July 25, 2008 which established a schedule for completion of the EIS process and issuance of a final decision on the merits of the transaction. The Decision effective July 25, 2008 called for the Final EIS to be completed between December 1, 2008 and January 31, 2009 with a final decision incorporating the issues on the merits or economic side and the environmental side as soon as possible after the FEIS is approved. On September 8, 2008 STB issued a Decision that rejected CN's request to decide the merits side first and adhered to the procedural schedule set in the Decision effective July 25, 2008.

C. NEPA Regulations and Procedures

The regulations that govern the preparation of EIS's were adopted by the Council on Environmental Quality and are published at 40 CFR Part 1500. These regulations require SEA to assess indirect and cumulative effects as well as the direct effects of the Proposed Action. The CEQ regulations define indirect effects as those that are "caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable"(40 CFR 1508.8(b)). The CEQ regulations define cumulative effects as "the impact on the environment which results from the incremental impact of the proposed action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions" (40 CFR 1508.7).

D. Endangered Species Act Existing Regulations

The regulations that govern consultation between SEA and FWS over the effects of the Proposed Action on endangered species are codified at 50 CFR Part 402, Subpart B. These regulations apply to "…all actions in which there is discretionary Federal involvement or control." (50 CFR 402.03) These regulations provide for resolution of these effects through informal consultation (50 CFR 402.13) or formal consultation (50 CFR 402.14). Informal consultation can terminate the consultation process if SEA determines and FWS concurs that the Proposed Action is not likely to adversely affect endangered species or critical habitat. (50 CFR 402.13(a)). During informal consultation, FWS can suggest modifications to the Proposed Action that SEA and CN could implement to avoid the likelihood of adverse effects on endangered species or critical habitat (50 CFR 402.13(b))

Formal consultation can be initiated by SEA or FWS. If FWS requests formal consultation, the request must be in writing and the basis for the request must be stated (50 CFR 402.14(a)).

During formal consultation, FWS must consider the effects of the Proposed Action and cumulative effects on endangered species and critical habitat (50 CFR 402.14(g)(3)) and formulate a biological opinion as to whether the Proposed Action, taken together with cumulative effects, is likely to jeopardize the continued existence of an endangered species or result in the destruction or adverse modification of critical habitat (50 CFR 402.14(g)(4)). If FWS determines that the Proposed Action, taken together with cumulative effects, is likely to jeopardize the continued existence of an endangered species or result in the adverse modification of critical habitat; FWS may discuss with SEA and CN the availability of reasonable and prudent alternatives that SEA and CN can take to avoid jeopardy.

The regulations that govern consultation define "cumulative effects" as follows:

> *Cumulative effects* are those effects of future State or private activities, not involving Federal activities, that are reasonably certain to occur within the action area of the Federal action subject to consultation." (50 CFR 402.02)

The same regulation defines "action area" as follows:

> *Action area* means all areas to be affected directly or *indirectly* by the Federal action and not merely the immediate area involved in the action.

The same regulation defines "effects of the action" as follows:

> *Effects of the action* refers to the direct and indirect effects of an action on the species or critical habitat, together with the effects of other activities that are interrelated or interdependent with that action, that will be added to the environmental baseline. The environmental baseline includes the past and present impacts of all Federal, State, or private actions and other human activities in the action area, the anticipated impacts of all *proposed* actions in the action area that have already undergone formal or early section 7 consultation, and impacts of State or private actions which are contemporaneous with the consultation in process. Indirect effects are those that are caused by the proposed action and are later in time, but still are reasonably certain to occur. Interrelated actions are those that are part of a larger action and depend on the larger action for their justification. Interdependent actions are those that have no independent utility apart from the action under consideration.

At a meeting on November 7, 2008, FWS indicated that they interpret the definition of "indirect effects" in the definition of "effects of the action" to include the effects of actions that are the preferred alternative of the entity that would carry out those actions.

Surface Transportation Board
395 E Street, S.W.
Washington, D.C. 20423-0001

Re: ***Canadian National Railway Company and Grand Trunk Corporation – Control – EJ&E West Company*** **(STB Finance Docket No. 35087)**

Dear Ms. Rutson:

I am writing, on behalf of Applicants Canadian National Railway Company and Grand Trunk Corporation (together, "Applicants"; together with their rail carrier subsidiaries, "CN"), to provide you and HDR Engineering, Inc. ("HDR"), with the response to your seventh request for information in this proceeding, as made in your letter of October 23, 2008, to Normand Pellerin of CN.

> Please clarify the pre-transaction and post-transaction train traffic on the CN Joliet subdivision. We need to know whether there is actually a change or not.

CN's Joliet Subdivision includes CN segments 14 (between Bridgeport and Lemoyne), 15 (between Lemoyne and Glenn Yard), 16 (between Glenn Yard and Argo), 17 (between Argo and Lemont), and 18 (between Lemont and Joliet), as identified in the Operating Plan. At present, an average of 10 Amtrak trains per day (5 trains daily in each direction) and 4.3 Metra trains per day (3 trains Monday through Friday in each direction) are scheduled to operate over the Joliet Subdivision. In addition, BNSF has trackage rights on the Joliet Subdivision between Joliet and Glenn Yard (segments 16 and 17), and it operates two trains per day (one in each direction) over those segments. In addition, CN operates a number of unscheduled local trains out of Glenn Yard to serve industries on the Joliet Subdivision.

The train counts reported for these segments in Attachment A.1 to CN's Operating Plan, as filed with the Application and corrected by CN-14 (filed January 2, 2008), did

not include Amtrak or Metra passenger trains, or any CN local freight trains, because operations of those trains were not expected to change as a result of the Transaction.

Information about pre-Transaction freight traffic (reported in the "Base" column under "Freight – Trains/Day" in Attachment A.1) was based on actual traffic data from 2006, the last year for which complete data were available at the time the Operating Plan was prepared. Those data indicated that BNSF operated an average of 1.8 trains per day between Joliet and Glenn Yard (*i.e.*, on CN segments 16, 17, and 18), where they would be interchanged to or from CN. (Since 2006, BNSF traffic has increased sufficiently that the railroad now regularly operates two trains per day over segments 16, 17, and 18 (one train in each direction), as reported earlier.) Attachment A.1 indicates that, in addition to the 1.8 BNSF trains per day, an average of 4.0 CN trains per day operates over segment 16 between Argo (where they move to or from the IHB line) and Glenn Yard. (If the train counts in the "Base" column of Attachment A.1 were revised to reflect the change in BNSF's operations since 2006, it should show 6.0 trains per day on segment 16, and 2.0 trains per day on segments 17 and 18.)

CN expects that, after implementation of the proposed Transaction, the BNSF trains now operating between Joliet and Glen Yard would instead be interchanged with CN at Eola, and thus would not move on the Joliet Subdivision at all. CN also expects that the 4.0 trains now moving between Glenn Yard and Argo would not longer do so, because CN would route those trains over the EJ&EW line instead of via IHB. On the other hand, CN expects that it would operate two trains a day between East Joliet Yard (which would become available to CN as a result of the Transaction) and Glenn Yard. (These 2.0 trains per day are reported in the "Total" column for segments 16, 17, and 18 under "Freight – Trains/Day" in Attachment A.1. If the "Change" column under "Freight – Trains/Day" is revised to reflect the change in BNSF's operations, it would show a decrease of 4.0 trains per day on segment 16, and a net change of 0.0 trains per day on segments 17 and 18.)

North of Glenn Yard, Attachment A.1 indicates that an average of 2.1 trains per day currently operate over segments 15 (between Glenn Yard and Lemoyne) and 14 (between Lemoyne and Bridgeport). At Bridgeport, CN's Freeport Subdivision meets the Joliet Subdivision, and the train count on CN segment 9 (between Bridgeport and 16th Street) therefore includes, not only the 2.1 trains per day that operate between Glenn Yard and Bridgeport, but also 2.5 trains a day that move to or from the Freeport Subdivision, for a total of 4.6 trains per day. These numbers are reported in the "Base" column under "Freight – Trains/Day" on Attachment A.1. These numbers do not include local trains, which would not be affected by the Transaction.

Following implementation of the Transaction, CN expects that all the trains shown on Attachment A.1 as moving on segments 9, 14, and 15 would be rerouted to operate

over the EJ&EW line. The post-Transaction train counts for segments 9 and 14 are therefore shown as 0.0 trains per day in the "Total" column under "Freight - Trains/Day" on Attachment A.1. The "Total" column for segment 15, however, erroneously shows 2.0 trains per day. This number represents a BRC "puller," which operates once a day in each direction between Lemoyne (where it moves to and from the BRC line) and Glenn Yard. This train was omitted from the pre-Transaction train counts reported in the "Base" column, and should therefore have been omitted from the post-Transaction train counts in the "Total" column. If the post-Transaction train count for segment 15 is corrected to 0.0 trains per day, then the "Change" from pre-Transaction to post-Transaction train volumes would be a decrease of 4.6 trains per day on segment 9, and a decrease of 2.1 trains per day on segments 14 and 15.

To summarize, the train counts on the Joliet Subdivision, as shown in Attachment A.1 but revised to reflect the corrections explained above, are as follows:

Rail Line Segment Description				Freight - Trains/Day		
Road	Segment Number	From Station	To Station	Base (pre-Transaction)	Change	Total (post-Transaction)
CN	9	16thSt	Bridgeport	4.6	(4.6)	0.0
CN	14	Bridgeport	Lemoyne	2.1	(2.1)	0.0
CN	15	Lemoyne	Glenn Yard	2.1	(2.1)	0.0
CN	16	Glenn Yard	Argo	6.0	(4.0)	2.0
CN	17	Argo	Lemont	2.0	0.0	2.0
CN	18	Lemont	Joliet	2.0	0.0	2.0

As you can see from this table, the Transaction is expected to result in no net change in the number of trains moving on CN segments 17 and 18, and to result in a decrease in the number of trains moving on CN segments 9, 14, 15, and 16.

If you need any further explanation of CN's calculations of pre-Transaction and post-Transaction train numbers, please let me know, and I will provide you whatever additional information I can.

Very truly yours,

Paul A. Cunningham /jmg

Brief History of the EJ&E Railway

Indiana Department of Natural Resources Concurrence Letter

Illinois SHPO Concurrence Letter

Brief History of the EJ&E Railroad

Chicago has long been associated with American railroading. During the 1840's the city had become the focal point for much of the railroad construction in the country. By the 1850's numerous main lines radiated out of Chicago.[2] Chicago quickly became the Midwest's center for commerce and trade and within a few decades the city grew to be the hub of an immense transportation network that stretched across the nation (Stover 1997). Nineteenth century Chicago was transformed into a web of neighborhoods, farm communities, and industrial towns, many connected to the city by the railroad (see Figure 1). Farmers used trains to transport produce into the city daily; businessmen rode the rails to their homes in the outlying communites; and families took vacations mere miles outside the downtown Chicago residential areas. Railroads linked together Chicago's settlements-farm centers, industrial towns, commuter suburbs, and recreational and institutional centers (Keating 2005; Reiff et al. n.d.).

Following the initial wave of railroad construction in the 1840s-1850s, a second wave of railroad building exploded upon the Chicago scene in the 1880s.[3] It was this second wave that spurred the rise of belt line railways around Chicago. Through merger and acquisition the railroads ultimately expanded into four major belt systems, one of which became known as the Elgin, Joliet & Eastern Railway (Young 2005).[4]

The Elgin, Joliet & Eastern Railway (EJ&E, but also known as the Chicago Outer Belt Line or, colloquially, the "J") began as a homegrown project in the southwest Chicago suburban satellite city of Joliet in 1884, with the incorporation of the Joliet, Aurora & Northern Railway. In 1887, financier J. P. Morgan's banking house bought out the local investors and created the EJ&E of Illinois and the EJ&E of Indiana. The following year the two railways merged to become the Elgin, Joliet & Eastern Railway Company. The EJ&E constructed new tracks and acquired existing lines over the next five years. By 1892, coal hauling, which had been the EJ&E's principal source of revenue, was surpassed by interchange traffic services as the use of the belt lines became accepted railroad practice. The following year, the EJ&E's 130-mile main line extended from Waukegan (IL) to Porter (IN) and connected with every line-haul steam railroad serving Chicago. Two years later, with the mushrooming of the belt line trade, the EJ&E recorded its first profitable year. Between 1894 and 1901, the EJ&E extended its line to the Gary-East Chicago-Hammond area on the southern shore of Lake Michigan. By 1899, the "J" had expanded to a 190-mile belt line hauling more than quadruple the freight it had carried only a decade earlier (Dale 2002; Blaszak 1989).

By the dawn of the 20th century and continuing to the present-day, the EJ&E developed a close partnership with the steel industry. In 1898, the EJ&E was acquired by the Federal Steel Company and by 1901 the latter company was consolidated under the newly-created U.S. Steel (USS) corporation. With the construction of USS's huge Gary Works (1906-

[2] Among the early railroads were the Chicago & North Western; the Chicago, Burlington & Quincy; the Gulf, Mobile & Ohio; the Illinois Central; the New York Central; and the Chicago, Rock Island & Pacific.

[3] Among this second wave of railroads were the Grand Trunk & Western; the Erie; the Wabash, St. Louis & Pacific; New York, Chicago & St. Louis (the Nickel Plate); the Atchison, Topeka & Santa Fe; the Chicago Great Western; and the Wisconsin Central (later the Soo Line); and the Chicago, Indianapolis & Louisville (later the Monon).

[4] The other three systems were the Belt Railway of Chicago; the Indiana Harbor Belt; and the Baltimore & Ohio Chicago Junction.

1909), EJ&E was in the steel business for good. It was the extension of trackage to the Gary Works that essentially completed the EJ&E main line (Blaszak 1989). A map of the EJ&E main line and its connections as of 1909 is shown in Figure 1.

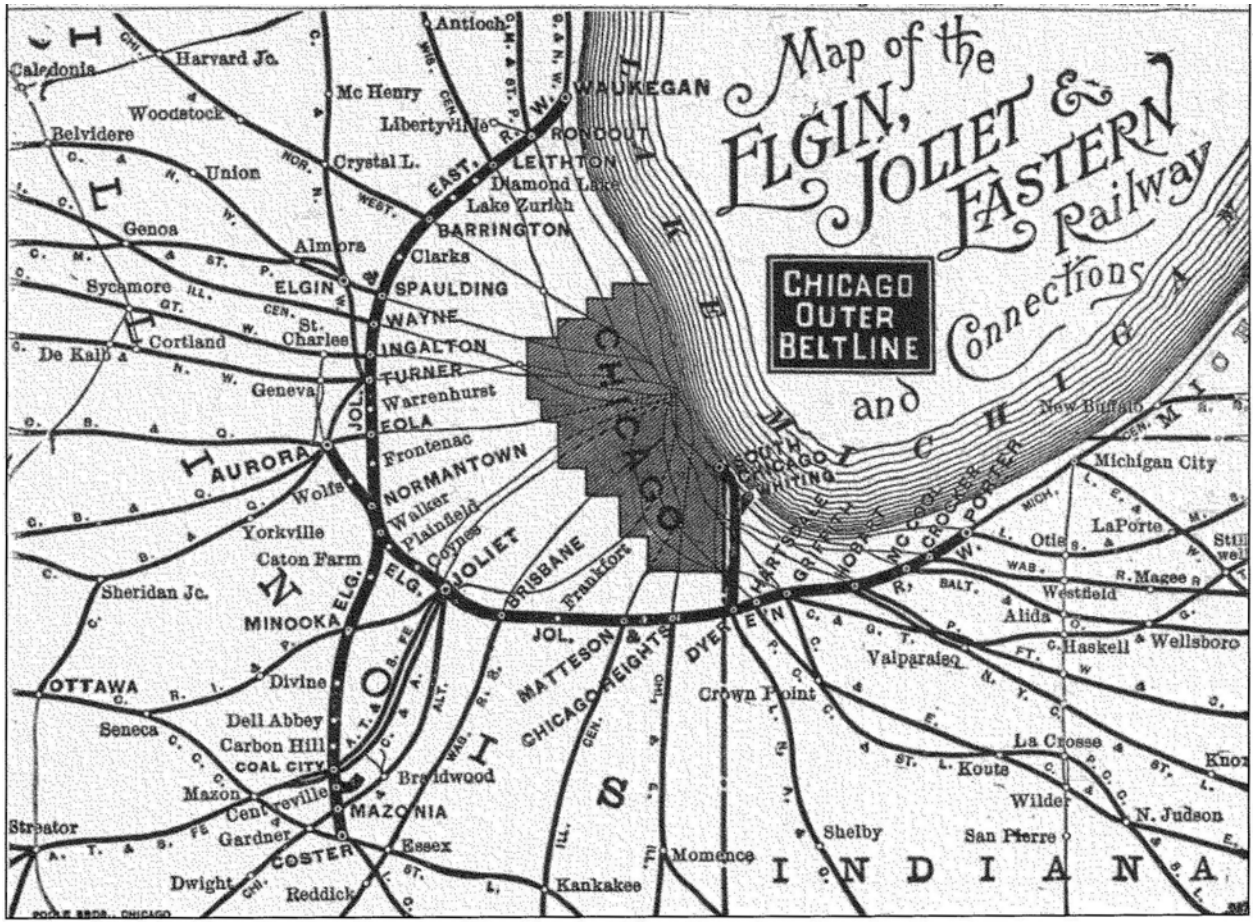

Figure 1. EJ&E Railway connections in 1909.

By World War I, the EJ&E had become an "established and highly profitable carrier." Wartime demand for armaments and post-war production of automobiles and other steel-based products kept the steel industry – and the EJ&E – very busy. Industrial development proceeded apace with the growth of satellite cities along the EJ&E main line, providing the railroad with a "wealth of carloadings" (Blaszak 1989). On the eve of the Great Depression, the EJ&E was "a major player on the Chicagoland scene, providing USS with reliable service to the steel mills, interchanging with all the trunk lines, and hauling huge amounts of coal". Revenues during the 1920's reached nearly $40 million before the Great Depression set in at decade's end (Blaszak 1989).

The EJ&E was not only a freight hauler and trunk line interchanger. In the late 1800's and early 1900's, regular passenger service was provided. In those days, there a double-daily run between Joliet and Aurora and short-lived first-class service along the entire Waukegan, IL-to-Porter, IN main line. This service was described as "plain Jane" (Blaszak 1989). After 1900, however, the interurban lines built between Aurora, Joliet, and Chicago Heights, which

offered faster and cheaper service, quickly usurped most of the EJ&E's passenger service. Dedicated passenger service disappeared by 1907, replaced by mixed-train (passengers in the caboose) service, which survived into the 1960's (Blaszak 1989; Jaenicke and Eisenbrandt 2007).

The Depression years were tough on the steel industry. The EJ&E's prosperity in the 1920's evaporated quickly, with traffic and revenues plummeting to less than a third its levels attained just three years earlier. Big cutbacks in the coal and steel industries eroded EJ&E's traffic base, which was further aggravated by major litigation involving alleged violations of the Interstate Commerce Act (Blaszak 1989).

Traffic and revenues quickly rebounded for the EJ&E with America's entry into World War II. The EJ&E supported as many as fifty train movements per day to support Chicago's steel and heavy manufacturing industries during the war years (ICC 1943). The EJ&E's prosperity continued well into the 1950s, with shipments averaging 41 million tons per year. However, problems were also beginning to mount due to several factors, including the trunk lines' improved ability to interchange traffic and bypassing the belt lines, the increasing loss of short-haul freight business to trucks, USS shifting its operations and diverting some shipments to trucks, and a severe economic downturn in 1958-1961. By the decade's close, EJ&E's traffic had dropped to 28 million tons per year (Blaszak 1989). A map of the railroad pattern in the Chicago region as it appeared in 1950 is reproduced in Figure 2.

During the 1960s and 1970s, EJ&E labored to offset these losses. Chicago's urban expansion was converting farmland into bedroom communities and many industries were following their employees' emigration pattern, abandoning their Chicago plant locations for new suburban locations. EJ&E agents successfully attracted more than 30 new plants to sites along its tracks during the 1960s and 1970s. Coal also made a comeback during the 1960s and by 1975 had resumed its position as EJ&E's highest volume commodity, displacing iron and steel. Meanwhile, the American steel industry had its own problems, as it was losing ground to low-cost foreign competitors and more and more products were being manufactured using plastics. This, and the unabated rise of truck freighting, cut into the EJ&E operating margin. The railroad, however, managed to recapture some of this eroding business through operational changes (e.g., SCAT program, short for Service Commitments Attract Tonnage) and acquiring the Chicago, Rock Island & Pacific, which provided a boost in steel, grain, sand, and chemical traffic (Blaszak 1989).

The 1980s and beyond witnessed the declining fortunes of the American steel industry. USS's Joliet Works and South Works, which was between Rainbow Beach and Calumet Park, vastly reduced operations. EJ&E's traffic was drastically reduced in lock-step with these trends and its income declined from a 1979 peak of $20 million to $7.4 million in 1984. The three-year steel strike (1984-1987) was very costly. EJ&E abandoned some of its mainlines (Aurora, Griffith to Porter), and single-tracked double main lines in some areas in the mid-1980s ((Blaszak 1989). Finally, in 1988, USX (the renamed USS) sold EJ&E to Transtar, only to have USX reacquire EJ&E during a reorganization in 2001 (Dale 2002).

During the 1990s, the EJ&E became an alternative for freight moving through Chicago such as coal and containerized import/export freight, in order to avoid the congestion on rail lines that pass through the center of Chicago. Despite all changes in economic activity, however, the EJ&E was at all times an integral part of the rail system and economic infrastructure of

Chicago, supporting the needs of Class 1 railroads, numerous local rail-dependent shippers, and Chicago's role as a principal manufacturing, transportation, and commercial hub for North America.

Communities along the EJ&E benefited from the freight and passenger transportation services provided by the EJ&E. These services enabled or enhanced the ability of these communities to become centers for commerce and services, and function as a shipping point for farm commodities. The EJ&E strengthened that aspect of community growth, and encouraged the development of economic activity that required rail transportation such as farming of grain and general manufacturing. The EJ&E also enabled homes and businesses to purchase coal for home heating moved by rail from southern and central Illinois coal fields, thus encouraging growth of the communities.

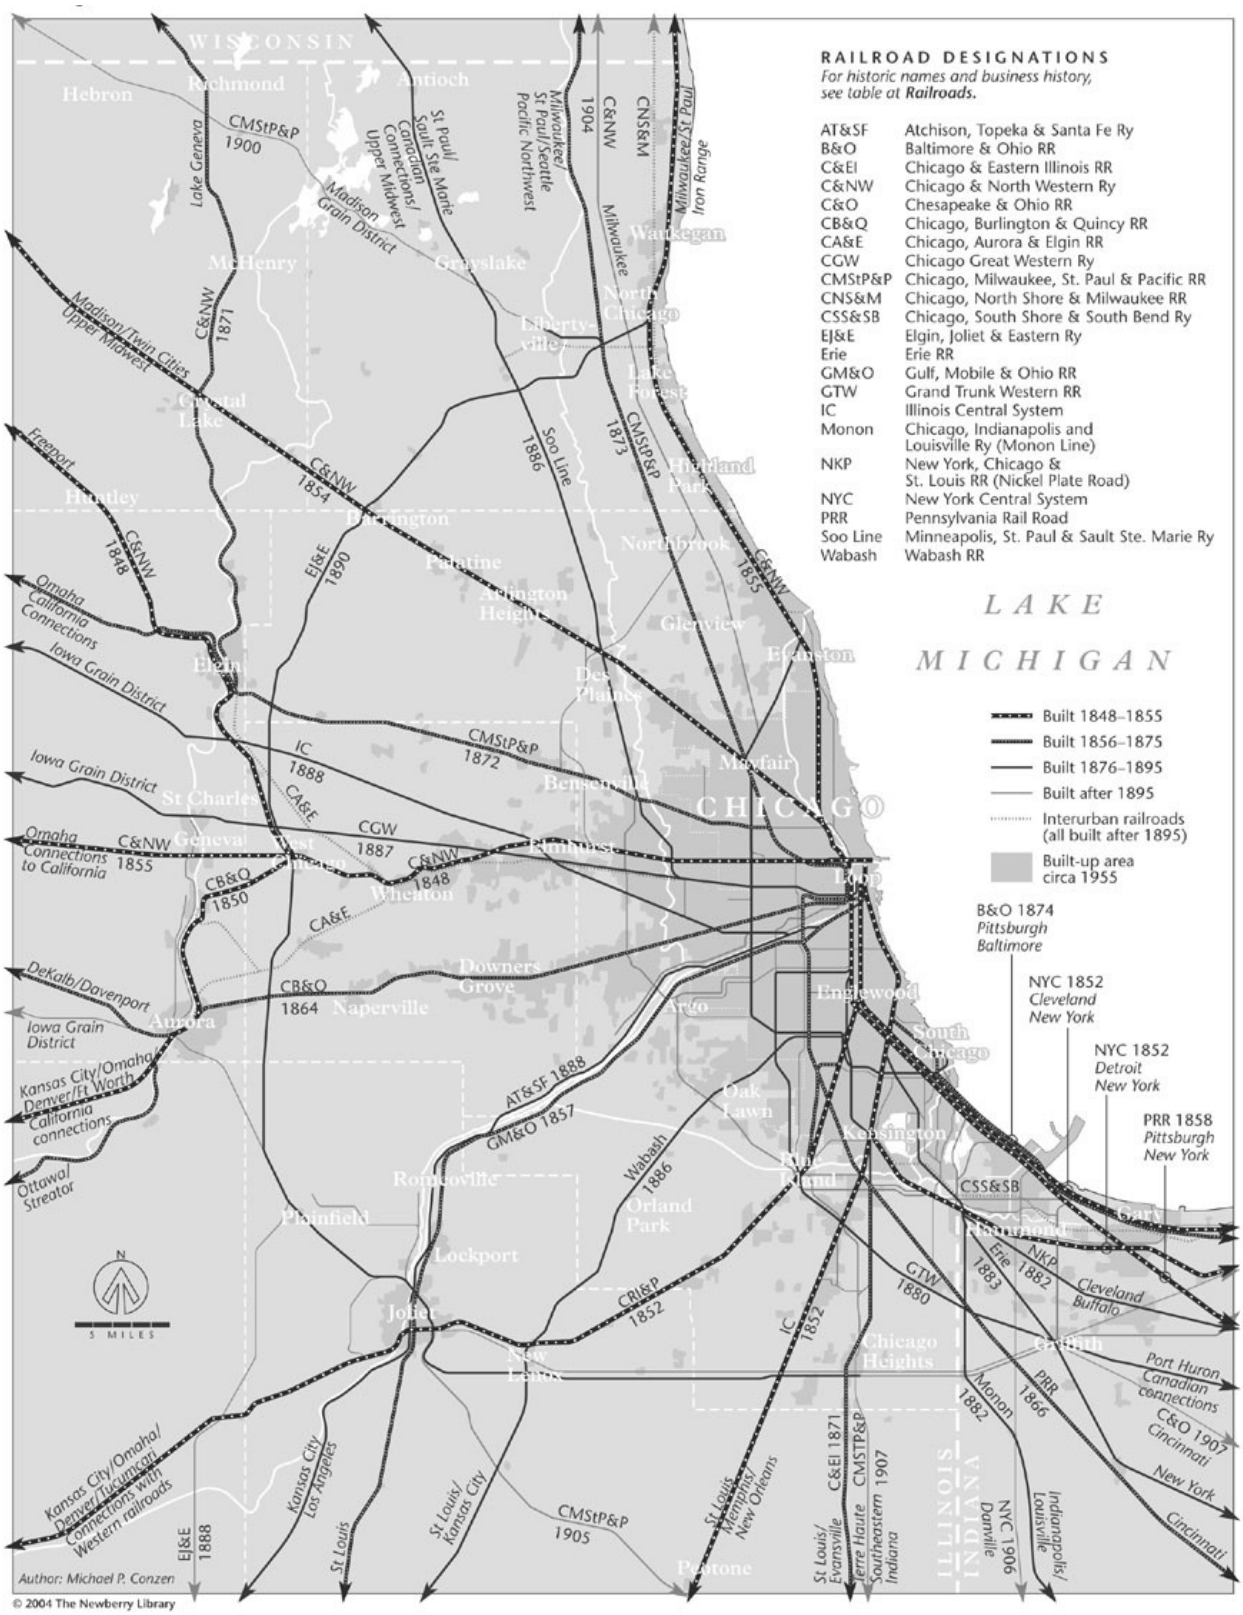

Figure 2. Chicago rail pattern in 1950 (reproduced by permission of the Newberry Library).

SEA recognizes that train volumes on the EJ&E, as well as the trunk lines it intersects, have fluctuated during its history in response to technological and economic changes. Historically, train volumes along the EJ&E generally ranged between 10 and 20 trains per day (see Table 1).

The availability of multiple modes of transportation has spurred population growth throughout human history, and this is well documented in the settlement and growth of the United States. Rail and shipping routes played significant roles in defining the early and ongoing development patterns of the Great Lakes region, including the area along the current-day alignment of the EJ&E. By the time the EJ&E's immediate predecessor arrived in the area (1886), it was following the establishment of numerous other railroads in the area surrounding Chicago from the 1850s on; and in fact, it acquired existing rail properties to incorporate into its own system. The EJ&E began its own operations in 1889.

The reciprocal relationships between the early railroads and towns like Matteson, Barrington, North Chicago, Waukegan, and Joliet had already developed, as freight service hauling grain and supplies allowed development, and agricultural and increasingly urbanized development spurred further rail service. An examination of the changes in population between 1880 and 1900, with the appearance of the EJ&E in the middle of that time period, shows two trends. In one set of instances, growth appears either to begin (the founding of U.S. Steel-dependent Gary, Indiana, and the population footholds at Matteson and Lake Zurich, Illinois, for example) or jump significantly (as in Waukegan and Joliet, Illinois) during the period that includes introduction of the EJ&E. Joliet nearly tripled its population from 11,657 in 1880 to 29,353 in 1900. In other cases, there appears to be steady growth alongside the railroads, with new rail development such as the EJ&E simply co-existing and reciprocally supporting development of village populations—for example, Plainfield, West Chicago, and Barrington. In Barrington, however, a near doubling of population did occur, between 1890 (pop 848) and 1910 (1,444) during a time at which many rail connections, including interurban electrified railroads were being built. In at least two cases, the extension of the EJ&E rail line (or a predecessor line) directly led to the birth of one community (Lake Zurich) and sparked a real estate boom in another community (Plainfield) (Reiff et al., and Blaszak 1989).

Table 1. Regular Scheduled Freight and Passenger Trains 1893-1970 (Freight unless designated by "P")

Victoria J. Rutson
Chief, Section of Environmental Analysis
Surface Transportation Board
395 "E" Street SW
Washington, DC 20423

Federal Agency: Surface Transportation Board

Re: Draft Environmental Impact Statement (EIS) concerning the acquisition of Elgin, Joliet and Eastern Railway Company (EJ&E) by the Canadian National Railway Corporation and Grand Trunk Corporation resulting in increases in rail traffic and the necessity for future rail construction (Docket #35087; DHPA #3488)

Dear Ms. Rutson:

Pursuant to Section 106 of the National Historic Preservation Act (16 U.S.C. § 470f) and 36 C.F.R. Part 800, the staff of the Indiana State Historic Preservation Officer ("Indiana SHPO") has conducted an analysis of the materials dated July 25, 2008 and received on July 29, 2008 for the above indicated project in Calumet and North townships, Lake County, Indiana.

Based upon the documentation available to the staff of the Indiana SHPO, we have not identified any historic buildings, structures, districts, or objects listed in or eligible for inclusion in the National Register of Historic Places within the probable area of potential effects.

In terms of archaeology, no currently known archaeological resources eligible for inclusion in the National Register of Historic Places have been recorded within the proposed project area. No archaeological investigations appear necessary provided that all project activities remain within areas disturbed by previous construction.

If any archaeological artifacts or human remains are uncovered during construction, demolition, or earthmoving activities, state law (Indiana Code 14-21-1-27 and 29) requires that the discovery must be reported to the Department of Natural Resources within two (2) business days. In that event, please call (317) 232-1646. Be advised that adherence to Indiana Code 14-21-1-27 and 29 does not obviate the need to adhere to applicable federal statutes and regulations.

At this time, it would be appropriate for the Surface Transportation Board to analyze the information that has been gathered from the Indiana SHPO, the general public, and any other consulting parties and make the necessary determinations and findings. Please refer to the following comments for guidance:

1) If the Surface Transportation Board believes that a determination of "no historic properties affected" accurately reflects its assessment, then it shall provide documentation of its finding as set forth in 36 C.F.R. §800.11 to the Indiana SHPO, notify all consulting parties, and make the documentation available for public inspection (36 C.F.R. §§ 800.4[d][1] and 800.2[d][2]).

2) If, on the other hand, the Surface Transportation Board finds that an historic property may be affected, then it shall notify the Indiana SHPO, the public and all consulting parties of its finding and seek views on effects in accordance with 36 C.F.R.§§ 800.4(d)(2) and 800.2(d)(2). Thereafter, the Surface Transportation Board may proceed to apply the criteria of adverse effect and determine whether the project will result in a "no adverse effect" or an "adverse effect" in accordance with 36 C.F.R. § 800.5.

An Equal Opportunity Employer
Printed on Recycled Paper

A copy of the revised 36 C.F.R. Part 800 that went into effect on August 5, 2004, may be found on the Internet at www.achp.gov for your reference. If you have questions about archaeological issues please contact Cathy Draeger at (317) 234-3791 or cdraeger@dnr.IN.gov. If you have questions about buildings or structures please contact Chad Slider at (317) 234-5366 or cslider@dnr.IN.gov. Additionally, in all future correspondence regarding the above indicated project, please refer to DHPA #3488.

Very truly yours,

James A. Glass, Ph.D.
Deputy State Historic Preservation Officer

Phillis Johnson-Ball
Surface Transportation Board
395 E Street, SW
Environmental Filing
Washington, DC 20423

Dear Ms. Johnson-Ball:

Acre(s): 0 Site(s): 0
Archaeological Contractor:

Thank you for submitting the results of the archaeological reconnaissance. Our comments are required by Section 106 of the National Historic Preservation Act of 1966, as amended, and its implementing regulations, 36 CFR 800: "Protection of Historic Properties".

Our staff has reviewed the archaeological Phase I reconnaissance report performed for the project referenced above. The Phase I survey and assessment of the archaeological resources appear to be adequate. Accordingly, we have determined, based upon this report, that no significant historic, architectural, and archaeological resources are located in the project area.

Please submit a copy of this letter with your application to the state or federal agency from which you obtain any permit, license, grant, or other assistance. Please retain this letter in your files as evidence of compliance with Section 106 of the National Historic Preservation Act of 1966, as amended.

Sincerely,

Anne E. Haaker

Anne E. Haaker
Deputy State Historic
Preservation Officer
AEH

Notes:

[1] NC = No Change. N/A = Not Applicable.

~~1.~~ [2] Line Segment CN 31 (UP). CN has trackage rights over UP-owned track.

~~2. For purposes of analysis, SEA used 3.5 trains per day for CN Rail Line Segments 19 and 20, as provided by BN in correspondence dated February 29, 2008. Subsequent correspondence from CN was received that changed the value to 5.4 trains per day; however, analyses were already complete. The lower value (3.5) will yield a more conservative estimate of potential benefits.~~

~~* = Changes in Segments CN-14 through 18 reflect modifications to trains per day as indicated by CN's Letter to SEA dated October 31, 2008.~~

									line.
Hammond	Highland Fire Department Headquarters/ Central Station	260667A	Ridge Road (US 6)	1.82	Y (37)	Y (58)	28	N	The community of Highland does not cross the EJ&E rail line (east of the tracks). Additionally, it is a straight-line drive down Ridge Road (US 6) from Highland Fire Department Headquarters/Central Station to get to the nearest grade ~~separated crossing~~ separation at Ridge Road (US 6).
East Chicago	Saint Catherine Hospital	~~260930Y~~ 260675S	~~Cline Avenue Ramp~~ Industrial Highway (US 12)	~~1.17~~ 1.84	N	N	29	N	The community of East Chicago does not cross the EJ&E rail line (east of the tracks). Additionally, Methodist Hospital – Northlake Campus and Methodist Hospital – Midlake Campus are east of the EJ&E rail line.

Notes:
[a] The delay time shown in the table reflects the greatest increase in delay calculated for all available routes from the facility.

[b] This facility is closer to East-West Tollway; however, there are access restrictions at this crossing (on-ramp is too far west). This facility is also closer to North Aurora Road; however, Aurora Fire Department – Station No. 8 could respond to calls east of the EJ&E rail line in this location.

[c] This facility is closer to East-West Tollway; however, there are access restrictions at this crossing (exit ramp on the west side is too far west) and it may not accommodate all emergency service apparatus.

[d] These facilities are closer to Butler Street; however, there are clearance restrictions at this crossing and it may not accommodate all emergency service apparatus; essentially assuming that this crossing cannot be used by any emergency service responder.

Appendix A – New Analysis and Corrections to Appendix E, Attachment E1 - Grade Crossing Delay Calculations

The following sections describe in detail SEA's evaluation of the highway/rail at-grade crossings that are effected by the Proposed Action. This section contains tables showing delay calculations for at-grade crossings that intersect the EJ&E and CN rail lines. Information that was not available or not published in the Draft EIS is shown in red.

Effects on Local and Regional Highway Systems

SEA evaluated the effects of the Proposed Action and No-Action Alternatives on the regional and local highway systems by first determining the vehicle delays at highway/rail crossings and then assessing how those delays could affect regional mobility. Vehicle crossing delays for EJ&E and CN as well as effects on regional mobility are described in the following section.

SEA analyzed and evaluated 99 highway/rail at-grade crossings along the EJ&E rail line and 155 along the CN subdivisions for the environmental analysis.

Parameters included in the analysis for vehicle delays from a single-train event include:

- Blocked crossing time per train, minutes (D_c)
- Average delay per delayed roadway vehicle, minutes (D_a)
- Vehicle queue, number of vehicles (Q)
- Average delay for all vehicles, minutes (D_v)

To evaluate the effects of a single-train event, SEA analyzed the following for multiple trains on a 24-hour basis:

- Total delayed vehicles per day (T_d)
- Total blocked crossing time, minutes
- Crossing level of service (LOS)

SEA also independently evaluated the roadways that cross the rail lines, in addition to evaluating the highway/rail at-grade crossings. Parameters included in the analysis of the roadway operations include:

- Vehicle queue length, feet
- Roadway LOS

The above parameters were calculated based on the existing number of trains (N), existing average train speed (V), length of trains (L), and the number of traffic lanes (NL) for the highway/rail at-grade crossing. The calculation was based on the 2007 ADT volumes—number of vehicles per day—for the existing roadways. SEA also determined the existing LOS for each highway/rail at-grade crossing. The LOS refers to the efficiency at which a highway/rail at-grade crossing operates when a train passes through. Letters from A to F represent the LOS, with LOS A indicating relatively free-flowing traffic and LOS F indicating extreme congestion.

EJ&E Highway/Rail At-Grade Crossings

SEA used the 2015 ADTs to analyze the No-Action and Proposed Action delays to show what the effect would be to vehicle delay along the EJ&E rail line. Even though Tables 4.4.4-1 and 4.4.4-2

show the vehicle delay calculations for the 99 crossings that SEA evaluated and the results of the analysis for crossing LOS and total vehicle traffic delay for a 24-hour period, only 88 of the 99 highway/rail at-grade crossings are discussed in detail below. Tables E1.2-1 and E1.2-2 provide additional information to supplement subsequent detailed discussions following the tables.

SEA also calculated the delay for the year 2020 using 2015 proposed train data (number of trains, lengths, and speeds) and 2020 ADT data for the purposes of potential future regional planning by local, regional and state government agencies. The year 2020 delay calculations assumed that the number of trains, train speed and length would remain the same as the data provided for the year 2015. The 2020 delay data is not discussed in detail. The delay calculations for 2020 are shown in Table E1.2-3.

E.1.1.1 Introduction to Appendix E

SEA identified 32 crossings along the EJ&E rail line and 26 crossings along CN rail line with 2007 and 2008 updated ADTs from IDOT and Lake County. These include11 crossings in Lake County, four crossings in DuPage County, 14 crossings in Will County and three crossings in the southeastern Cook County along the EJ&E rail line, and along CN rail line, 18 crossings on the Waukesha Subdivision, four along the Freeport Subdivision, one along the Joliet Subdivision and three along the Elsdon/Southbend Subdivision.

SEA used IDOT's 2007 ADTs and CN's revised train data for an updated crossing delay analysis for specific crossings along four of the five CN subdivisions. Tables E1.2-10 and E1.2-11 present the vehicle delay calculations for 59 crossings in the Waukesha, Freeport, Joliet and Elsdon/Southbend subdivisions and summarizes the results of analysis for LOS and total traffic delay on a 24-hour basis.

SEA had identified that the results of these updates has created revised analysis to reflect the changes. Keating Drive/83rd Street near Aurora has been added to the list of crossings to be analyzed, because it has now an updated ADT higher than 2500 threshold, bringing the total number of crossings to be analyzed from 87 to 88 along the EJ&E rail line. Sea also revised the delay calculation for the year 2020 using the updated 2015 proposed train data and updated 2020 ADT for the purpose of potential future regional planning by local, regional and state government agencies. Tables E1.2-1 through E1.2-3 show the results of the revised analysis.

E.1.1.2 Environmental Consequences Changes

Section 4.3 of the FEIS discussed the environmental consequences of the proposed action versus the no action alternative as it relates to local and regional highway systems, emergency vehicles, navigation, and airports. The following are the changes that occurred to at-grade crossing delays due to the new analysis discussed in section 2.5 of the FEIS.

E.1.1.2.1 At-Grade EJ&E Crossing Delays

The following sections discuss the re-evaluation of the delay analysis as a result of the updated traffic and train data for the EJ&E crossings.

The following sections discuss the results of the analysis for the 87 highway/rail at-grade crossings along the EJ&E rail line. The detail discussion for the EJ&E at-grade crossings is organized by counties, beginning with the northern section in Lake County, Illinois and ending with at-grade crossings in Lake County, Indiana. The detail discussion for at-grade crossings in Cook County is separated in to two sections, one on the west side and the other on the southeastern side, because EJ&E rail line crosses Cook County twice.

Lake County, Illinois

SEA calculated vehicle delays for 12 highway/rail at-grade crossings along the EJ&E rail line in Lake County. Table E1.2-4 shows the results of the analysis.

The Proposed Action would not affect the highway/rail at-grade crossings in EJ&E's Western mainline subdivision in Waukegan, North Chicago, Lake Bluff, Libertyville, Mettawa and Vernon Hills because train traffic would not increase on these segments. The effect due to the increase in the number of trains begins where CN and EJ&E rail lines intersect in Lake County near the western edge of Mundelein beginning at segment EJE 14B.

Increased train traffic in Lake County would result in minor increases in vehicle delays at highway/rail at-grade crossings. SEA determined that two ~~four~~ of the crossings would experience a decrease in the crossing LOS under the Proposed Action. These two ~~four~~ locations~~—Diamond Lake Road, IL 60/83,~~ Oakwood Road, and Lake Zurich's Main Street—drop from an LOS A to an LOS B. LOS B indicates that the flow of traffic is reasonably unimpeded at average speeds.

SEA's analysis also showed that the average increase in the number of trains from 5.3 to 20.3 for the Proposed Action would result in approximately doubling the average delay per delayed vehicle. However, the average amount of time that a driver would be delayed as a result of a single train event is still minimal for the Proposed Action, such as 2.3~~0~~ minutes for Diamond Lake Road.

SEA determined that even though the total delayed vehicles per day at some of the crossings— such as IL 60/83 near Mundelein, Old McHenry Road near Hawthorn Woods, and Northwest Highway in Barrington—show an increase, the increase is approximately sevenfold at all of the crossings. The total number of delayed vehicles per day for Diamond Lake Road increased from ~~57~~ 39 vehicles to ~~442~~ 263 for the Proposed Action, and at Cuba Road it increased from ~~66~~ 65 to ~~456~~ 454 vehicles.

For the total blocked crossing time in a 24-hour period, SEA determined that the change from the No-Action to the Proposed Action varied between 2.9 percent and ~~4.3~~ 3.7 percent. The blocked crossing time for a 24-hour period is a measure of how long it would take for all the trains to cross an intersecting roadway. For example, under the No-Action Alternative the total blocked crossing time at Lake Zurich Road is ~~9.0~~ 6.9 minutes per 24 hours, or ~~0.6~~ 0.5 percent of the day. Under the Proposed Action, the total blocked crossing time at the same crossing is ~~70.7~~ 48.6 minutes, or ~~4.9~~ 3.4 percent of the day. The percent change for the total blocked crossing time at Lake Zurich Road is ~~4.3~~ 2.9 percent. The percent change is a measure of how much change has occurred as far as total blocked crossing time due to the Proposed Action. For additional information on the results of SEA's vehicle delay analysis, including the blocked crossing time, for the 12 Lake County highway/rail at-grade crossings, see Tables E1.2-1 and E1.2-2.

Traffic volume on all 12 crossings except Lake Zurich Road has been updated with IDOT and Lake Countys' 2007 and 2008 ADTs, with Diamond Lake Road, Oakwood Road, Main Street and Old Rand Road receiving the highest percentage reduction. Old McHenry Road and Northwest Highway (US 14) were the only roadways whose ADT is higher than what was used in the Draft EIS. Diamond Lake Road and IL 60 & 83 also showed train operation change with train speed updated for the Proposed Action.

The result of the analysis changed the crossing LOS for Diamond Lake Road and IL 60 &83 from B to A for the Proposed Action scenario. The total delayed vehicles per day also changed for each crossing that has experienced a change in traffic volume. The change in train speed for Diamond Lake Road reduced the average delay per delayed vehicle from 2.3 minutes to 2.0 minutes. The total number of delayed vehicles per day on Diamond Lake Road decreased from 442 to 263 for the Proposed Action.

The total blocked crossing time decreased from 4.3 percent to 3.7 percent for the Proposed Action. As an example, the total blocked crossing time decreased from 70.7 minutes to 48.6 minutes for the Proposed Action. Under the No Action, the total blocked crossing time decreased from 9.0 minutes to 6.9 minutes per 24 hours.

West Cook County

The analysis in western Cook County is limited to the area between Lake and DuPage counties. SEA analyzed four highway/rail at-grade crossings in western Cook County. Table E1.2-5 shows the results of the delay analysis.

SEA determined that the crossing LOS for the No-Action Alternative remains unchanged under the Proposed Action. SEA also determined that the Proposed Action results in approximately doubling the average delay per delayed vehicle at the four highway/rail at-grade crossings. There are 71 delayed vehicles per day at the Lake Cook Road at-grade crossing for the No-Action Alternative, and 499 total delayed vehicles for the Proposed Action. Similarly, there are 90 total delayed vehicles per day at West Bartlett Road at-grade crossing for the No-Action Alternative and 612 delayed vehicles for the Proposed Action.

SEA also noted that the total blocked crossing time at Lake Cook Road experienced 7.1 minutes, or 0.5 percent of the day, under the No-Action Alternative. The at-grade crossing is blocked for 7.1 minutes based on the average 5.3 trains per day. The analysis for the Proposed Action showed that the total blocked crossing time for the same location is 50.5, or 3.5 percent of the day. The percent change for the total blocked crossing time at Lake Cook Road is 3.0. For additional information on the results of SEA's analysis of vehicle delay as well as blocked crossing time at each crossing in western Cook County, see Tables E1.2-1 and E1.2-2.

DuPage County

SEA analyzed 11 highway/rail at-grade crossings in DuPage County. The ADT counts for Aurora and Church streets do not meet the analysis threshold of 2,500 or more vehicles; however, they do meet the analysis threshold of crossings that are less than 800 feet apart. Table E1.2-6 shows the results of the delay analysis.

SEA determined that the crossing LOS for the No-Action Alternative changes at several crossings due to the Proposed Action. Particularly, Washington and Church Street crossings change from LOS A to C. Even though the average delay per delayed vehicle for a single-train event results in less than 2.5 minutes for these crossings, SEA determined that the proposed speed of the train through the crossings is lower than the average train speed through the other crossings as shown in Table 4.4.4-7. The slower train speed would result in a longer running time because of physical restrictions near the highway/rail at-grade crossings: a tight curve and the UP crossing north of Washington Street, a UP railroad yard northeast of the two crossings, and another railroad yard south of Church Street. In addition, the number of proposed trains per day at Washington Street would increase to 31.6.

SEA's analysis showed that the increase in the number of trains for the Proposed Action would result in an increase in the average delay per delayed vehicle. At Ogden Avenue and Montgomery Road, the average delay per delayed vehicles changes from 1.2 minutes for the No-Action scenario to 1.5 minutes for the Proposed Action. The increase in the average amount of time that a driver would be delayed as a result of a single train event varies between 0.3 minutes at Ogden Avenue and Montgomery Road to one minute at Hawthorne Lane, where it changed from 0.9 minutes for the No-Action Alternative to 1.9 minutes for the Proposed Action.

The analysis also showed that even though the total number of delayed vehicles per day at Army Trail Road, Smith Road, and Hawthorne Lane is lower than total delayed vehicles at most of the crossings, those crossings have the highest percentage increase for total delayed vehicles.

SEA determined that the total blocked crossing time in 24–hour period for Washington Street would increase from 27.2 minutes, or 1.9 percent of the day, for the No-Action Alternative, to 117.2 minutes

(1.95 hours) for the Proposed Action, or 8.1 percent of the day. The percent change for the total vehicle traffic delay for Washington Street is 6.3 percent, the highest increase compared to the other at-grade crossings. The percent change in total blocked crossing time is lowest at Stearns Road (3.2 percent) and the highest at Washington Street (6.3 percent). The difference in total blocked crossing time for each crossing can be attributed to train length, train speed and number of trains. See Tables E1.2-1 and E1.2-2 for additional information on the results of SEA's analysis of vehicle delay as well as blocked crossing time for each of the 11 crossings in DuPage County.

Only four crossings in DuPage County had updated ADTs. They are Stearns Road, Diehl Road, Liberty Street and Ogden Avenue (US 34). Stearns Road and Ogden Avenue showed an increase in ADT while Diehl Road and Liberty Street showed a reduction in ADT. The increase in ADT showed an increase in the total delayed vehicles per day for Stearns Road and Ogden Avenue and the decrease in ADT for Diehl Road and Liberty Street showed a lesser value for total delayed vehicles per day.

Will County

SEA analyzed ~~33~~ 34 highway/rail at-grade crossings along the EJ&E rail line in Will County. The ADT counts for Plainfield-Naperville Road, Center Street, and Eastern Avenue in Plainfield do not meet the analysis threshold of 2,500 or more vehicles, but they meet the analysis threshold of crossings that are less than 800 feet apart. Table E1.2-7 shows the results of the delay analysis.

SEA determined that the Proposed Action would result in minor increases, less than 0.6 minutes, in the average delay per delayed vehicle at the ~~33~~ 34 highway/rail at-grade crossings, with three exceptions: Woodruff Road and Washington Street showed a 1.8-minute increase in delay, and South Rowell Avenue (the northern crossing) showed a 1.4 minute increase, 1.8 minutes for the No-Action and 3.2 minutes for the Proposed Action.

SEA determined the longest train running time would occur on the rail line segment between Woodruff Road and Washington Street in Joliet. The location of the East Joliet Yard between the two highway/rail at-grade crossings results in slower train speeds as trains approach the yard. The LOS at two crossings, Woodruff Road and Washington Street in Joliet, drops from B and A, respectively, to F, because it takes a longer time for the trains to pass as traffic accumulates at the crossing. The longer it takes for the train to pass, the more vehicles are delayed. The crossing LOS at South Rowell Avenue (northern crossing) also falls from A to D, better than Woodruff Road and Washington Street but worse than the other crossings. Trains traveling southbound from the Washington Street at-grade crossing, pick up speed when they get to South Rowell Avenue and are moving more quickly by the next crossing at Mills Road. The LOS for the majority of other crossings drops from the current level of A to B under the Proposed Action.

SEA determined the total blocked crossing time in a 24-hour period for Woodruff Road would increase from 73.3 minutes, or 5.1 percent of the day, for the No-Action Alternative, to 288 minutes (4.8 hours), or 20 percent of the day. This would give a percent change for total blocked crossing time of 16.7 percent. Similarly, the total vehicle traffic delay in 24-hour period for Washington Street and South Rowell Avenue (northern crossing) is 33.9 and 17.7 minutes, or 2.4 percent and 1.2 percent of the day, respectively, for the No-Action Alternative. For the Proposed Action, the total delay increases to 229.1 minutes (3.8 hours), or 15.9 percent of the day, for Washington Street and 140.6 minutes (2.34 hours), or 9.8 percent of the day, for South Rowell Avenue (northern crossing). The percent change for Washington Street would be 14.4 percent, for South Rowell Avenue (northern crossing), 9.0 percent. For additional information on the results of SEA's analysis of vehicle delays as well as blocked crossing time at each highway/rail at-grade crossing in Will County, see Tables E1.2-1 and E1.2-2.

In the Draft EIS, 33 crossings were analyzed in Will County. The updated ADTs at several of these crossings changed the total number of crossings analyzed from 33 to 34. Keating Drive/87th Street near Aurora now has an ADT that exceeds the 2500 ADT threshold for environmental analysis used in the Draft EIS. All of the crossings with updated ADTs have their total delayed vehicles per day changed. Two of the major increases in ADT occurred at Keating Drive/83rd Street and Van Dyke Road where the increase in ADT more than doubled. The numbers of trains per day at Van Dyke Road and 143rd Street have been updated based on the EJ&E segment revision.

Southeastern Cook County

SEA evaluated 12 highway/rail at-grade crossings in southeastern Cook County, located between Will County and the Illinois-Indiana state boundary. Table E1.2-8 shows the result of the delay analysis.

SEA determined that the crossing LOS for the No-Action Alternative changes from A to C at six of the crossings. These crossings are Main Street, Chicago Road, West End Avenue/Halsted Street, East End Avenue, Wentworth Avenue, and State Street.

The increase in the number of trains for the Proposed Action would result in an increase in the average delay per delayed vehicle. The increase in the average amount of time that a driver would be delayed as a result of a single train event varies between 0.4 minutes at Ridgeland Avenue, where the average delay per delayed vehicle is 1.1 for the No-Action and 1.5 minutes for the Proposed Action, to 1.9 ~~one~~ minutes at ~~Wentworth Avenue~~ East End Avenue Connector. The average delay per delayed vehicle for these crossings approximately doubles because trains must slow down for CN rail crossings near East End Avenue.

The number of delayed vehicles per day for most ~~all~~ of the crossings increased more than four ~~five~~ times. At Ridgeland Avenue ~~and Cicero Avenue,~~ the increase—six fold-is highest.

SEA also determined that the total blocked crossing time in a 24–hour period for Chicago Road would increase from 21.1 minutes, or 1.5 percent of the day, to 117.9 minutes (approximately 2 hours) for the Proposed Action, or 8.2 percent of the day. The percent change for the total vehicle traffic delay for Chicago Road is ~~7.2~~ 6.7 percent. The percent change for the total blocked crossing time ~~at Ridgeland Avenue (3.9 percent) and~~ is the highest at Wentworth Avenue at 8.5 percent. For additional information on the results of the SEA's vehicle delay calculations as well as blocked crossing time, see Tables E1.2-1 and E1.2-2.

The ADT for three crossings have been updated and they all show a reduction in traffic volume. Cicero Avenue and Lincoln Highway both showed significant changes in ADT. SEA received train speed updates from CN for three crossings, Cicero Avenue, Main Street and Western Avenue. In the Draft EIS a weighted average was used for train speed to show the combined effect of the mainline and the connectors at the Main Street and East End Avenue crossings. SEA re-evaluated the results of the delay analysis to include both the mainline and the connectors separately. In order to accommodate this analysis the train speed for Main Street and the connectors at both crossings were revised. The results of the revised analysis showed that the average delay per delayed vehicle is the highest at East End Avenue because the train speed on the connector is the slowest, even though the number of trains, at 2.6 trains per day, is the lowest number.

Lake County, Indiana

SEA evaluated 15 highway/rail at-grade crossings in Lake County, Indiana. Table E1.2-9 shows the results of the analysis.

SEA determined that the crossing LOS for one-third of the crossings changes from A to B. The increase in the average delay per delayed vehicle is approximately one minute for Broad, East Main, East Lake and East Miller streets and is approximately 0.5 minutes for the rest of the crossings.

SEA also determined that the total blocked crossing time in 24-hour period for ~~Broad and~~ East Main Street would increase from 14.0 minutes, or 1.0 percent of the day for the No-Action Alternative, to 94.4 minutes (1.6 hours), or 6.6 percent of the day for the Proposed Action. The percent change for the total vehicle traffic delay ~~for both streets~~ is 5.6 percent, the highest in the crossings listed in the table below. The percent change in total blocked crossing time is the lowest at West 9th Avenue. For additional information on the results of the SEA's vehicle delay calculations as well as blocked crossing time, see Tables E1.2-1 and E1.2-2.

There were no traffic data updates for roadways crossing the EJ&E rail line. However, similar to the Main Street and the East End Avenue crossings, the delay calculation for Broad Street crossing in Griffith was done using the weighted average of train speed for mainline, connector and the CN rail line. SEA re-evaluated the results of the delay analysis to include the mainline, connector and CN mainline separately. In order to accommodate the delay analysis at Broad Street train speed and number of trains at the EJ&E mainline and connector were evaluated and changed. The result of the revised analysis showed that Broad Street still has the highest average delay per delayed vehicle and East Main Street has now the highest total blocked crossing time and the highest percent change total blocked crossing time.

CN Highway/Rail At-Grade Crossings

SEA used the 2015 ADTs for analysis for existing delays and projected delays under the Proposed Action to show what the effect would be under the No-Action and Proposed Action alternatives. Tables E1.2-10 and E1.2-11 present the vehicle delay calculations for ~~130~~ 134 crossings in the Waukesha, Freeport, Joliet, Chicago and Elsdon/Southbend subdivisions, and summarize the results of analysis for LOS and total traffic delay on a 24-hour basis

SEA also calculated the delay for the year 2020 using 2015 proposed train data (number of trains, lengths, and speeds) and 2020 ADT data for the purposes of potential future regional planning by local, regional and state government agencies. The year 2020 delay calculations assumed that the number of trains, train speed and length would remain the same as the data provided for the year 2015. The 2020 delay data is not discussed in detail. The delay calculations for 2020 are shown in Table E1.2-12.

The following sections discuss the re-evaluation of the delay analysis as a result of the updated traffic and train data for the CN crossings.

4.4.5.1 Waukesha Subdivision

SEA analyzed ~~43~~ 44 highway/rail at-grade crossings along the Waukesha Subdivision. Table E1.2-13 shows the results of the delay analysis.

SEA reanalyzed 44 highway/rail at-grade crossings along the Waukesha Subdivision. Although all crossings were reanalyzed, the range of results from the new data affected 14 communities. These communities are listed below. The change in the ranges of data are reflected in number of trains (N), vehicular delay in minutes (Da), total delayed vehicles (Td) and total blocked crossing time. Table E1.2-13 shows the results of crossings in the new delay analysis.

River Forest

SEA evaluated four highway/rail at-grade crossings in River Forest: Forest Avenue, Augusta Street, Keystone Avenue, and Thatcher Avenue. Under the Proposed Action, daily train traffic through these crossings drops from ~~3.5~~ 5.4 to zero trains. Additional results include a decrease in vehicular delays. In addition, reduction in train traffic reduces delays from 1.8 minutes to zero seconds per delayed vehicle. In addition, the total number of delayed vehicles falls from ~~21~~ 32 (~~69~~106 at Thatcher Road) to zero vehicles per day. The decrease in the number of trains also reduces the total blocked time for each crossing from ~~10~~ 15 minutes to zero minutes per day. The analysis shows that all crossing criteria would improve; therefore, the current LOS A does not change under the Proposed Action.

The No Action number of daily train traffic increases to 5.4, from 3.5 that was in the DEIS. The No Action number of delayed vehicles increases to 106, from 69 that was in the DEIS. The No Action total blocked crossing time increases to 15 minutes, from 10 minutes in the DEIS.

River Grove

SEA evaluated two highway/rail at-grade crossings in River Grove: 1st Avenue (IL 171) and 5th Avenue. Under the Proposed Action, daily train traffic through these crossings drops from ~~3.5~~ 5.4 to zero trains. Therefore, vehicular delays decrease. The reduction in train traffic reduces delays from 1.8 minutes to zero seconds per delayed vehicle and reduces the total number of delayed vehicles from ~~219~~ 383 and ~~83~~129, respectively, to zero vehicles per day. The decrease in the number of trains reduces the total blocked time for each crossing from ~~10~~ 15 minutes to zero minutes per day. The analysis shows that all crossing criteria improve; therefore, the current LOS A does not change under the Proposed Action.

The No Action number of daily train traffic increases to 5.4, from 3.5 that was in the DEIS. The No Action number of delayed vehicles increases to 383, from 219 that was in the DEIS. The No Action total blocked crossing time increases to 15 minutes, from 10 minutes in the DEIS.

Melrose Park

SEA evaluated one highway/rail at-grade crossing in Melrose Park: George Street. Under the Proposed Action, daily train traffic through the crossing drops from ~~3.5~~ 5.4 to zero trains. Therefore, vehicular delays decrease. The reduction in train traffic reduces delays from 1.9 minutes to zero seconds per delayed vehicle and also reduces the total number of delayed vehicles from ~~34~~ 52 to zero vehicles per day. The decrease in the number of trains also reduces the total blocked time for the crossing from ~~10~~ 16 minutes to zero minutes per day. The analysis shows that all crossing criteria improve; therefore, the current LOS A does not change under the Proposed Action.

The No Action number of daily train traffic increases to 5.4, from 3.5 that was in the DEIS. The No Action number of delayed vehicles increases to 52, from 34 that was in the DEIS. The No Action total blocked crossing time increases to 16 minutes, from 10 minutes in the DEIS.

Franklin Park

SEA evaluated two highway/rail at-grade crossings in Franklin Park: Belmont Avenue and Fullerton Avenue. Under the Proposed Action, daily train traffic through these crossings drops from ~~3.5~~ 5.4 and 19.3, respectively, to zero and two trains. Therefore, vehicular delays decrease. The reduction in train traffic reduces delays from 2.1 and 2.8 minutes, respectively, to zero seconds and 1.4 minutes per delayed vehicle and also reduces the total number of delayed vehicles from 685 and ~~38~~ 59, respectively, to zero and 34 vehicles per day. The decrease in the number of trains also reduces the total blocked time for each crossing from ~~11~~ 18 and 83 minutes, respectively to zero and four minutes per day. The Proposed Action LOS for Belmont Avenue improves from LOS B to LOS A. Fullerton Avenue has no change from LOS A under the Proposed Action.

Daily train traffic increases to 5.4, from 3.5 in the DEIS. The No Action number of delayed vehicles increases to 59, from 38 that was in the DEIS. The total blocked time for the No Action increases to 18 minutes, from 11 minutes in the DEIS.

Des Plaines

SEA evaluated 13 highway/rail at-grade crossings in Des Plaines: Pratt Avenue, Touhy Avenue, Frontage Road, Prospect Avenue, Oakton Street, Algonquin Road, Lee Street/Mannheim Road (US 12), Graceland Avenue (US 12), Thacker Street/Dempster Street, Prairie Avenue, Golf Road, Rand Road, Seegers Road and Central Road. Under the Proposed Action, daily train traffic through these crossings drops from 19.1 to two trains. Therefore, vehicular delays decrease. The reduction in train traffic reduces delays from 2.4 at most to no more than 1.2 minutes per delayed vehicle and also reduces the range of total number of delayed vehicles from ~~1,450~~ 1,404 to ~~84~~ 81 vehicles per day. The decrease in the number of trains also reduces the total range of blocked time for each crossing from 71 minutes to four minutes per day. The analysis shows that all crossing criteria improve. The Proposed Action LOS for Pratt Avenue, Seegers Road, Golf Road and Rand Road improves from LOS B to LOS A. The remaining crossings have no change from LOS A under the Proposed Action.

The No Action number of delayed vehicles decreases to 1,404, from 1,450 that was in the DEIS. The Proposed Action number of delayed vehicles decreases to 81, from 84 in the DEIS.

Near Mount Prospect

SEA evaluated one highway/rail at-grade crossing Near Mount Prospect: Kensington Road/Foundry Road. Under the Proposed Action, daily train traffic through the crossing drops from 19.1 to two trains. Therefore, vehicular delays decrease. The reduction in train traffic reduces delays from 1.6 minutes to approximately 55 seconds per delayed vehicle and also reduces the total number of delayed vehicles from 326 to 19 vehicles per day. The decrease in the number of trains also reduces the total blocked time for the crossing from 46 minutes to three minutes per day. The analysis shows that all crossing criteria improve; therefore, the current LOS A does not change under the Proposed Action.

Mount Prospect

SEA evaluated one highway/rail at-grade crossing Near Mount Prospect: Euclid Avenue. Under the Proposed Action, daily train traffic through the crossing drops from 19.1 to two trains. Therefore, vehicular delays decrease. The reduction in train traffic reduces delays from 1.6 minutes to approximately 45 seconds per delayed vehicle and also reduces the total number of delayed vehicles from 722 to 41 vehicles per day. The decrease in the number of trains also reduces the total blocked time for the crossing from 46 minutes to three minutes per day. The analysis shows that all crossing criteria improve; therefore, the current LOS A does not change under the Proposed Action.

Prospect Heights

SEA evaluated three highway/rail at-grade crossings in Prospect Heights: Camp McDonald Road, Wolf Road, and Hintz Road. Under the Proposed Action, daily train traffic through these crossings drops from 19.1 to two trains. Therefore, vehicular delays decrease. The reduction in train traffic would reduce delays from 1.5 minutes to approximately 45 seconds (1.6 minutes to approximately 55 seconds at Hintz Road) per delayed vehicle and also reduces the total number of delayed vehicles per day from 782 and 322, respectively, to 45 and 19 (824 to 48 at Hintz Road). The decrease in the number of trains reduces the total blocked time for each crossing from 47 and 45 minutes to three minutes per day. The analysis shows that all crossing criteria improve; therefore, the current LOS A does not change under the Proposed Action.

Wheeling

SEA evaluated two highway/rail at-grade crossings in Wheeling: Willow Road and Dundee Road (IL 68). Under the Proposed Action, daily train traffic through these crossings drops from 19.1 to two trains. Therefore, vehicular delays decrease. The reduction in train traffic reduces delays from 1.6 and 1.5 minutes, respectively, to approximately 55 seconds per delayed vehicle and also reduces the total number of delayed vehicles from 113 and ~~1,175~~ 1,199, respectively, to seven and ~~73~~ 74 vehicles per day. The decrease in the number of trains also reduces the total blocked time for each crossing from 46 and 43 minutes to three minutes per day. The analysis shows that all crossing criteria improve; therefore, the current LOS A does not change under the Proposed Action.

The No Action number of delayed vehicles increases to 1,199, from 1,175 that was in the DEIS. The Proposed Action number of delayed vehicles increases to 74, from 73 in the DEIS.

Buffalo Grove

SEA evaluated two highway/rail at-grade crossings in Buffalo Grove: Deerfield Parkway/Busch Road and Buffalo Grove Road. Under the Proposed Action, daily train traffic through these crossings drops from 19.1 to two trains. Therefore, vehicular delays decrease. The reduction in train traffic reduces delays from 1.7 and 1.5 minutes, respectively, to approximately 55 and 45 seconds per delayed vehicle and also reduces the total number of delayed vehicles from ~~716~~ 799 and ~~533~~ 488, respectively, to ~~41~~ 46 and ~~32~~ 29 vehicles per day. The decrease in the number of trains also reduces the total blocked time for each crossing from 50 and 43 minutes to three minutes per day. The analysis shows that all crossing criteria improve; therefore, the current LOS A does not change under the Proposed Action.

The No Action number of delayed vehicles increases to 799, from 716 that was in the DEIS. The Proposed Action number of delayed vehicles increases to 46, from 41 in the DEIS.

Prairie View

SEA evaluated one highway/rail at-grade crossing in Prairie View: Aptakisic Road. Under the Proposed Action, daily train traffic through the crossing drops from 19.1 to two trains. Therefore, vehicular delays decrease. The reduction in train traffic reduces delays from 1.7 minutes to approximately 55 seconds per delayed vehicle and also reduces the total number of delayed vehicles from ~~1,041~~ 1,000 to ~~60~~ 58 vehicles per day. The decrease in the number of trains also reduces the total blocked time for the crossing from 50 minutes to three minutes per day. The analysis shows that all crossing criteria improve; therefore, the current LOS A does not change under the Proposed Action.

The No Action number of delayed vehicles decreases to 1,000, from 1,041 that was in the DEIS. The No Action number of delayed vehicles decreases to 58, from 60 in the DEIS.

Near Prairie View

SEA evaluated one highway/rail at-grade crossing Near Prairie View: Half Day Road (IL 22). Under the Proposed Action, daily train traffic through the crossing drops from 19.1 to two trains. Therefore, vehicular delays decrease. The reduction in train traffic reduces delays from 1.5 minutes to approximately 55 seconds per delayed vehicle and also reduces the total number of delayed vehicles from ~~781~~ 736 to ~~47~~ 44 vehicles per day. The decrease in the number of trains also reduces the total blocked time for the crossing from 44 minutes to three minutes per day. The analysis shows that all crossing criteria improve; therefore, the current LOS A does not change under the Proposed Action.

The No Action number of delayed vehicles decreases to 736, from 781 that was in the DEIS. The Proposed Action number of delayed vehicles decreases to 44, from 47 in the DEIS.

Near Vernon Hills

SEA evaluated one highway/rail at-grade crossing Near Prairie View: US 45. Under the Proposed Action, daily train traffic through the crossing drops from 19.1 to two trains. Therefore, vehicular delays decrease. ~~Although there is no change in train traffic from approximately 55 seconds per delayed vehicle, there is still a reduction in the total number of delayed vehicles from 422 to 44 per day.~~ The reduction in train traffic reduces delays from 1.5 minutes to 55 seconds per delayed vehicle. There is also a reduction in the total number of delayed vehicles from 665 to 42 vehicles per day. The decrease in the number of trains also reduces the total blocked time for the crossing from ~~26~~ 43 minutes to three minutes per day. The analysis shows that all crossing criteria improve; therefore, the current LOS A does not change under the Proposed Action.

The No Action number of delayed vehicles increases to 665, from 422 that was in the DEIS. The Proposed Action number of delayed vehicles decreases to 42, from 44 in the DEIS. The No Action average delay per delayed vehicle increases to 1.5 minutes, from 55 seconds in the DEIS. The No Action total blocked crossing time increases to 43 minutes, from 26 minutes in the DEIS.

Vernon Hills

SEA evaluated one highway/rail at-grade crossing Near Prairie View: Butterfield Road. Under the Proposed Action, daily train traffic through the crossing drops from 19.1 to two trains. Therefore, vehicular delays decrease. ~~Although there is no change in train traffic from approximately 55 seconds per delayed vehicle, there is still a reduction in the total number of delayed vehicles from 376 to 39 per day.~~ The reduction in train traffic reduces delays from 1.6 minutes to 55 seconds per delayed vehicle. There is also a reduction in the total number of delayed vehicles from 581 to 36 vehicles per day. The decrease in the number of trains also reduces the total blocked time for the crossing from ~~27~~ 46 minutes to three minutes per day. The analysis shows that all crossing criteria improve; therefore, the current LOS A does not change under the Proposed Action.

The No Action number of delayed vehicles increases to 581, from 376 that was in the DEIS. The Proposed Action number of delayed vehicles decreases to 36, from 39 in the DEIS. The No Action average delay per delayed vehicle increases to 1.6 minutes, from 55 seconds in the DEIS. The No Action total blocked crossing time increases to 46 minutes, from 27 minutes in the DEIS.

Mundelein

SEA evaluated six highway/rail at-grade crossings in Mundelein: Townline Road (IL 60), Allanson Road, Hawley Street, Park Street, Maple Avenue, and Winchester Road. Under the Proposed Action, daily train traffic through these crossings ~~does not change from 19.1 trains~~ drops from 20.8 to 17.8

(19.1 to two at Townline Road (IL 60)) trains. ~~Therefore, vehicular delays do not decrease. Although the train delay in minutes per delayed vehicle does not change from 1.8 (1.6 at Winchester Road), there is a decrease in the range of total number of delayed vehicles from 848 to 541 vehicles per day. Although there is no change in the number of trains, the total blocked time for Townline Road (IL 60) reduced from 26 minutes to three minutes per day. There is no change in total blocked time for Hawley Street, Park Street and Maple Street at 52 minutes (46 minutes at Winchester Road) per day. Train speed decrease at Allanson Road results in an increase of average delay per delayed vehicle from 1.8 minutes to 2.8 minutes and an increase of total delayed vehicles from 761 to 1226 per day. The total blocked time for Allanson Road increases from 52 minutes to 83 minutes.~~ The range of vehicular delays increase from 1.7 and 1.5 minutes to no more than 2.4 minutes per delayed vehicle. The delay for Townline Road (IL 60) reduces from 1.5 minutes to approximately 55 seconds per delayed vehicle. There is a decrease in the range of total number of delayed vehicles from 1,341 to 883 vehicles per day. Although there is a decrease in trains, the train speed increases the range of total blocked time from 54 to no more than 64 minutes per day. The Proposed Action LOS for Allanson Road worsens from LOS A to LOS B. The remaining crossings have no change from LOS A under the Proposed Action.

The No Action number of daily train traffic increases to 20.8, from 19.1 that was in the DEIS. The Proposed Action number of daily train traffic increases to 17.8, from 19.1 that was in the DEIS. The No Action number of delayed vehicles increases to 1,341, from 848 that was in the DEIS. The Proposed Action number of delayed vehicles decreases to 883, from 1,226 in the DEIS. The No Action average delay per delayed vehicle decreases to 1.7 minutes, from 1.8 minutes in the DEIS. The Proposed Action average delay per delayed vehicle increases to 2.4 minutes, from 1.9 minutes in the DEIS. The No Action total blocked crossing time increases to 54 minutes, from 52 minutes in the DEIS. The Proposed Action total blocked crossing time decreases to 66 minutes, from 83 minutes in the DEIS.

~~*Gray's Lake*~~

~~*SEA evaluated two highway/rail at-grade crossings in Gray's Lake: Peterson Road and Harris Road. Under the Proposed Action, daily train traffic through these crossings does not change from 19.1 trains. Therefore, vehicular delays do not decrease. Although the train delay in minutes per delayed vehicle does not change from 1.4, there is no change total number of delayed vehicles from 651 and 130 vehicles per day. There is no change in the number of trains; therefore, the total blocked time for each crossing did not reduced from 42 minutes per day. The analysis shows that there is no change in crossing criteria; therefore, the current LOS A does not change under the Proposed Action.~~*Near Libertyville*

Near Mundelein

SEA evaluated one highway/rail at-grade crossing Near Mundelein: Peterson Road. Under the Proposed Action, daily train traffic through the crossing drops from 20.8 to 17.8 trains. Although there is a decrease in train traffic, vehicular delays increase from 1.4 minutes to 1.6 minutes per delayed vehicle. There is a reduction in the total number of delayed vehicles from 625 to 604 vehicles per day. The decrease in the number of trains also reduces the total blocked time for the crossing from 44 minutes to 43 minutes per day. The analysis shows that all crossing criteria improve; therefore, the current LOS A does not change under the Proposed Action.

The No Action number of daily train traffic increases to 20.8, from 19.1 that was in the DEIS. The Proposed Action number of daily train traffic increases to 17.8, from 19.1 that was in the DEIS. The No Action number of delayed vehicles decreases to 625, from 651 that was in the DEIS. The

Proposed Action number of delayed vehicles decreases to 604, from 651 in the DEIS. The Proposed Action average delay per delayed vehicle increases to 1.6 minutes, from 1.4 minutes in the DEIS. The No Action total blocked crossing time increases to 44 minutes, from 42 minutes in the DEIS. The Proposed Action total blocked crossing time increases to 43 minutes, from 42 minutes in the DEIS.

SEA evaluated one highway/rail at-grade crossing Near Mundelein: Harris Road. Under the Proposed Action, daily train traffic through the crossing drops from 20.8 to 17.8 trains. Although there is a decrease in train traffic, vehicular delays increase from 1.4 minutes to 1.6 minutes per delayed vehicle. There is a reduction in the total number of delayed vehicles from 137 to 132 vehicles per day. The decrease in the number of trains also reduces the total blocked time for the crossing from 44 minutes to 43 minutes per day. The analysis shows that all crossing criteria improve; therefore, the current LOS A does not change under the Proposed Action.

The No Action number of daily train traffic increases to 20.8, from 19.1 that was in the DEIS. The Proposed Action number of daily train traffic increases to 17.8, from 19.1 that was in the DEIS. The No Action number of delayed vehicles increases to 137, from 130 that was in the DEIS. The Proposed Action number of delayed vehicles decreases to 132, from 130 in the DEIS. The Proposed Action average delay per delayed vehicle increases to 1.6 minutes, from 1.4 minutes in the DEIS. The No Action total blocked crossing time increases to 44 minutes, from 42 minutes in the DEIS. The Proposed Action total blocked crossing time increases to 43 minutes, from 42 minutes in the DEIS.

4.4.5.2 Freeport Subdivision

SEA analyzed ~~28~~ 29 highway/rail at-grade crossings along the Freeport Subdivision. Table E1.2-14 shows the results of the delay analysis.

SEA reanalyzed 10 highway/rail at-grade crossings along the Freeport Subdivision. The range of results from the new data affected six communities. These communities are listed below. The change in the ranges of data are reflected in number of trains (N), vehicular delay in minutes (Da), total delayed vehicles (Td) and total blocked crossing time. Table E1.2-14 shows the results of crossings in the new delay analysis.

Chicago

SEA evaluated one highway/rail at-grade crossing in Chicago: Pulaski Road. Under the Proposed Action, daily train traffic through this crossing drops from 2.5 to zero trains. Therefore, vehicular delays decrease. The reduction in train traffic reduces delays from 2.4 minutes to approximately 20 seconds per delayed vehicle and would also reduce the total number of delayed vehicles from 176 to zero vehicles per day. The decrease in the number of trains reduces the total blocked time for the crossing from 9 minutes to zero minutes per day. The analysis shows that all crossing criteria improve; therefore, the current LOS A does not change under the Proposed Action.

Berwyn

SEA evaluated one highway/rail at-grade crossing in Berwyn: Riverside Drive. Under the Proposed Action, daily train traffic through this crossing drops from 4.4 to 1.7 trains. Therefore, vehicular delays decrease. The reduction in train traffic would reduce delays from 2.3 minutes to 1.2 minutes per delayed vehicle and also reduces the total number of delayed vehicles from 59 to 12 vehicles per day. The decrease in the number of trains also reduces the total blocked time for the crossing from 16 minutes to three minutes per day. The analysis shows that all crossing criteria improve; therefore, the current LOS A does not change under the Proposed Action.

Riverside

SEA evaluated one highway/rail at-grade crossing in Riverside: Harlem Avenue (IL 43). Under the Proposed Action, daily train traffic through this crossing drops from 4.4 to 1.7 trains. Therefore, vehicular delays decrease. The reduction in train traffic reduces delays from 2.3 minutes to 1.2 minutes per delayed vehicle and reduces the total number of delayed vehicles from ~~382~~ 427 to ~~79~~ 88 vehicles per day. The decrease in the number of trains also reduces the total blocked time for the crossing from 16 minutes to three minutes per day. The analysis shows that all crossing criteria improve; therefore, the current LOS A does not change under the Proposed Action.

The No Action number of delayed vehicles increases to 427, from 382 that was in the DEIS. The Proposed Action number of delayed vehicles increases to 88, from 79 in the DEIS.

North Riverside

SEA evaluated ~~four~~ two highway/rail at-grade crossings in North Riverside: 26th Street and Des Plaines Avenue. Under the Proposed Action, daily train traffic through these crossings drops from 4.4 to 1.7 trains. Therefore, vehicular delays decrease. The reduction in train traffic reduces delays from 2.3 to 1.2 minutes per delayed vehicle and also reduces the total number of delayed vehicles from 193 and 175, respectively, to 36 and 40 vehicles per day. The decrease in the number of trains also reduces the total blocked time for each crossing from 16 minutes to three minutes per day. The

analysis shows that all crossing criteria improve; therefore, the current LOS A does not change under the Proposed Action.

Near North Riverside

SEA evaluated ~~four~~ two highway/rail at-grade crossings near North Riverside: Cermak Road/22nd Street and 1st Avenue (IL 171). Under the Proposed Action, daily train traffic through these crossings drops from 4.4 to 1.7 trains. Therefore, vehicular delays decrease. The reduction in train traffic reduces delays from 2.3 to 1.2 minutes per delayed vehicle and also reduces the total number of delayed vehicles from 440 and ~~460~~ 408, respectively, to 91 and ~~95~~ 84 vehicles per day. The decrease in the number of trains also reduces the total blocked time for each crossing from 16 minutes to three minutes per day. The analysis shows that all crossing criteria improve; therefore, the current LOS A does not change under the Proposed Action.

The No Action number of delayed vehicles decreases to 408, from 460 that was in the DEIS. The Proposed Action number of delayed vehicles decreases to 84, from 95 in the DEIS.

Broadview

SEA evaluated one highway/rail at-grade crossing in Broadview: 17th Avenue. Under the Proposed Action, daily train traffic through this crossing drops from 4.4 to 1.7 trains. Therefore, vehicular delays decrease. The reduction in train traffic reduces delays from 2.9 minutes to 1.5 minutes per delayed vehicle and also reduces the total number of delayed vehicles from 156 to 30 vehicles per day. The decrease in the number of trains also reduces the total blocked time for the crossing from 20 minutes to four minutes per day. The analysis shows that all crossing criteria would improve; therefore, the current LOS A does not change under the Proposed Action.

Hillside

SEA evaluated ~~one~~ two highway/rail at-grade crossings in Hillside: Harrison Street and Wolf Road. Under the Proposed Action, daily train traffic through ~~this~~ these crossing drops from three to 1.7 trains. Therefore, vehicular delays decrease. The reduction in train traffic reduces delays from 1.8 minutes to approximately 55 seconds per delayed vehicle and also reduces the total number of delayed vehicles from 105 to 31 per day. The decrease in the number of trains also reduces the total blocked time for the crossings from eight minutes to two minutes per day. The analysis shows that all crossing criteria would improve; therefore, the current LOS A does not change under the Proposed Action.

Elmhurst

SEA evaluated six highway/rail at-grade crossings in Elmhurst: York Street, Vallette Street, Argyle Avenue, Spring Road, Saint Charles Road and West Avenue. Under the Proposed Action, daily train traffic through these crossings drops from three to 1.7 trains. Therefore, vehicular delays decrease. The reduction in train traffic reduces the range of delays from 1.7 minutes to no more than 1 minute per delayed vehicle and also reduces the range of total number of delayed vehicles from 130 to 39 per day. The decrease in the number of trains also reduces the total blocked time for each crossing from from eight minutes and seven minutes, respectively to two minutes (eight minutes to three minutes for Vallette Street) per day. The analysis shows that all crossing criteria improve; therefore, the current LOS A does not change under the Proposed Action.

Villa Park

SEA evaluated three highway/rail at-grade crossings in Villa Park: Villa Avenue, Addison Avenue and North Avenue (IL 64). Under the Proposed Action, daily train traffic through these crossings

drops from 3 to 1.7 trains. Therefore, vehicular delays decrease. The reduction in train traffic reduces delays from 1.6 minutes to approximately 55 seconds per delayed vehicle and also reduces the range of total number of delayed vehicles from ~~311~~ 307 to ~~99~~ 97 per day. The decrease in the number of trains also reduces the total blocked time for each crossing from seven minutes to two minutes per day. The analysis shows that all crossing criteria improve; therefore, the current LOS A does not change under the Proposed Action.

The No Action number of delayed vehicles decreases to 309, from 311 that was in the DEIS. The Proposed Action number of delayed vehicles decreases to 97, from 99 in the DEIS.

Near Addison

SEA evaluated two highway/rail at-grade crossings near Addison: Grace Street and Swift Road. Under the Proposed Action, daily train traffic through these crossings drops from three to 1.7 trains. Therefore, vehicular delays decrease. The reduction in train traffic reduces delays from 1.7 and 1.5 minutes, respectively, to approximately 55 and 45 seconds per delayed vehicle and also reduces the total number of delayed vehicles from 49 and 108, respectively, to 15 and 34 per day. The decrease in the number of trains also reduces the total blocked time for each crossing from eight minutes and seven minutes, respectively, to two minutes per day. The analysis shows that all crossing criteria improve; therefore, the current LOS A does not change under the Proposed Action.

Near Bloomingdale

SEA evaluated two highway/rail at-grade crossings near Bloomingdale: Schmale Road and Army Trail Road. Under the Proposed Action, daily train traffic through these crossings drops from three to 1.7 trains. Therefore, vehicular delays decrease. The reduction in train traffic reduces delays from 1.6 and 1.5 minutes, respectively, to approximately 55 and 45 seconds per delayed vehicle and also reduces the total number of delayed vehicles from 159 and 199, respectively, to 47 and 60 per day. The decrease in the number of trains also reduces the total blocked time for each crossing from eight and seven minutes to two minutes per day. The analysis shows that all crossing criteria improve; therefore, the current LOS A does not change under the Proposed Action.

Bloomingdale

SEA evaluated one highway/rail at-grade crossings in Bloomingdale: Gary Road. Under the Proposed Action, daily train traffic through this crossing drops from three to 1.7 trains. Therefore, vehicular delays decrease. The reduction in train traffic reduces delays from 1.5 minutes to approximately 55 seconds per delayed vehicle and also reduces the total number of delayed vehicles from 105 to 31 per day. The decrease in the number of trains also reduces the total blocked time for the crossing from seven minutes to two minutes per day. The analysis shows that all crossing criteria would improve; therefore, the current LOS A does not change under the Proposed Action.

Hanover Park

SEA evaluated one highway/rail at-grade crossing in Hanover Park: Country Farm Road. Under the Proposed Action, daily train traffic through this crossing drops from three to 1.7 trains. Therefore, vehicular delays decrease. The reduction in train traffic reduces delays from 1.5 minutes to approximately 45 seconds per delayed vehicle and also reduces the total number of delayed vehicles from 184 to 56 per day. The decrease in the number of trains also reduces the total blocked time for the crossing from seven minutes to two minutes per day. The analysis shows that all crossing criteria improve; therefore, the current LOS A does not change under the Proposed Action.

Bartlett

SEA evaluated one highway/rail at-grade crossings in Bartlett: Sutton Road (IL 59). Under the Proposed Action, daily train traffic through this crossing drops from three to 1.7 trains. Therefore, vehicular delays decrease. The reduction in train traffic reduces delays from 1.5 minutes to approximately 45 seconds per delayed vehicle and also reduces the total number of delayed vehicles from ~~184~~ 262 to ~~56~~ 80 per day. The decrease in the number of trains also reduces the total blocked time for the crossing from seven minutes to two minutes per day. The analysis shows that all crossing criteria would improve; therefore, the current LOS A does not change under the Proposed Action.

The No Action number of delayed vehicles decreases to 262, from 296 that was in the DEIS. The Proposed Action number of delayed vehicles decreases to 80, from 90 in the DEIS.

Near Bartlett

SEA evaluated one highway/rail at-grade crossings near Bartlett: Powis Road. Under the Proposed Action, daily train traffic through this crossing does not change ~~drops~~ from ~~three to~~ 2~~.6~~ trains. Train speed decrease at Powis Road results in an increase of average delay per delayed vehicle from 1.7 minutes to 3.7 minutes and an increase of total delayed vehicles from ~~30~~ 20 to ~~57~~ 44 per day. The total blocked time for Powis Road increases from ~~eight~~ five minutes to ~~15~~ 11 minutes. Although the analysis shows that most crossing criteria worsens; the current LOS A does not change under the Proposed Action.

The No Action number of daily train traffic decreases to 2, from 3 that was in the DEIS. The Proposed Action number of daily train traffic decreases to 2, from 2.6 that was in the DEIS. The No Action number of delayed vehicles decreases to 20, from 30 that was in the DEIS. The Proposed Action number of delayed vehicles decreases to 44, from 57 in the DEIS. The No Action total blocked crossing time decreases to 5 minutes, from 8 minutes in the DEIS. The Proposed Action total blocked crossing time decreases to 11 minutes, from 15 minutes in the DEIS.

South Elgin

SEA evaluated two highway/rail at-grade crossings in South Elgin: IL 25 and Randall Road. Under the Proposed Action, daily train traffic through this crossing does not change from two trains per day ~~drops from three to 2.6 trains~~. This decrease in daily train traffic is not significant enough to change the vehicular delay time from 1.1 minutes~~, but it does reduces the total number of delayed vehicles from 37 and 160, respectively, to 32 and 139 per day~~ or the total number of delayed vehicles from 25 and 107 per day. The total blocked time for each crossing does not change from three minutes per day. ~~The decrease in the number of trains also reduces the total blocked time for the crossing from five minutes to four minutes per day.~~ The analysis shows that there is no change in crossing criteria; therefore, the current LOS A does not change under the Proposed Action ~~The analysis shows that all crossing criteria would improve; therefore, the current LOS A does not change under the Proposed Action~~.

The No Action number of daily train traffic decreases to 2, from 3 that was in the DEIS. The Proposed Action number of daily train traffic decreases to 2, from 2.6 that was in the DEIS. The No Action number of delayed vehicles decreases to 107, from 160 that was in the DEIS. The Proposed Action number of delayed vehicles decreases to 107, from 139 in the DEIS. The No Action total blocked crossing time decreases to 3 minutes, from 5 minutes in the DEIS. The Proposed Action total blocked crossing time decreases to 3 minutes, from 4 minutes in the DEIS.

4.4.5.3 Joliet Subdivision

SEA analyzed 10 highway/rail at-grade crossings along the Freeport Subdivision. Table E1.2-15 shows the results of the delay analysis.

Lemont

SEA evaluated three highway/rail at-grade crossings in Lemont: Pruxne Street/Illinois Street, Holmes Street, and Stephen Street. Under the Proposed Action, daily train traffic through these crossings increases from 1.8 to two trains. However, vehicular delays decrease. The reduction in train traffic reduces delays from 1.6 minutes (1.7 at Stephen Street) to 1.5 minutes per delayed vehicle but increases the range of total number of delayed vehicles from 46 to 47 per day. The increase in the number of trains would increase the total blocked time for each crossing from four minutes to five minutes per day (no change from five minutes for Stephen Street). The analysis shows that although most crossing criteria worsen, the current LOS A does not change under the Proposed Action.

Romeoville

SEA evaluated one highway/rail at-grade crossing in Romeoville: Romeo Road/135th Street. Under the Proposed Action, daily train traffic increases from 1.8 to two trains. Therefore, vehicular delays increase. The increase in train traffic through this crossing raises delays from 1.3 to 1.5 minutes per delayed vehicle and also increases the total number of delayed vehicles from 48 to 59 per day. The increase in the number of trains increases the blocked time for the crossing from three minutes to four minutes per day. The analysis shows that although all crossing criteria worsen, the current LOS A does not change under the Proposed Action.

Lockport

SEA evaluated four highway/rail at-grade crossings in Lockport: 9th Street (IL 7), 10th Street, 11th Street, and Division Street. Under the Proposed Action, daily train traffic increases from 1.8 to two trains. Therefore, vehicular delays increase. The increase in train traffic through these crossings raises delays from 1.3 to 1.6 minutes per delayed vehicle and also increases the range of total number of delayed vehicles from ~~76~~ 80 to ~~104~~ 110 at most per day. The increase in the number of trains would increase the blocked time for each crossing from four minutes to five minutes per day. The analysis shows that although all crossing criteria worsen, the current LOS A does not change under the Proposed Action.

The No Action number of delayed vehicles increases to 80, from 76 that was in the DEIS. The Proposed Action number of delayed vehicles increases to 110, from 104 in the DEIS.

Joliet

SEA evaluated two highway/rail at-grade crossings in Joliet: Ohio Street and Jackson Street. Under the Proposed Action, daily train traffic through these crossings does ~~not change~~ increase from ~~2.9~~ 1.8 to 2 trains per day ~~trains~~. Therefore, vehicular delays ~~do not decrease~~ increase. The train delay in minutes per delayed vehicle does not change from ~~5.9~~ 3.8 to 4.8 and ~~there is no change in~~ increases the total number of delayed vehicles from ~~131~~ 52 and ~~370~~ 74, respectively, to 148 and 211 vehicles per day. There is also ~~no change~~ an increase in the total blocked time for each crossing from ~~26~~ 10 to 15 minutes per day. The analysis shows that there is no change in crossing criteria; therefore, the current LOS ~~B~~ A does not change under the Proposed Action.

Joliet Subdivision

SEA reanalyzed one highway/rail at-grade crossings along the Joliet Subdivision. The range of results from the new data affected only one community. This community is listed below. The change in the ranges of data are reflected in number of trains (N), vehicular delay in minutes (D_a), total delayed vehicles (T_d) and total blocked crossing time. Table E1.2-15 shows the results of this crossing in the new delay analysis.

TABLE E1.2-15. JOLIET SUBDIVISION, CN HIGHWAY/RAIL AT-GRADE CROSSING VEHICLE DELAY DATA

Street	2015 ADT	Trains per Day, N		Train Speed, V		Average Delay per Delayed Vehicle, D_a		Total Delayed Vehicles per day, T_d		Number of Vehicles Queued, Q		Crossing LOS		Total Blocked Crossing Time (24-Hr), Minutes		Percent Change Total Blocked Crossing Time per 24-Hr

4.4.5.4 Chicago Subdivision

SEA analyzed two highway/rail at-grade crossings along the Chicago Subdivision. Table E1.2-16 shows the results of the delay analysis.

~~*University Park*~~

~~SEA evaluated two highway/rail at-grade crossings in University Park: University Parkway/Stuenkel Road and West Dralle Road. Under the Proposed Action, daily train traffic through these crossings does not change drops from 12.8 13.8 to 12.3 trains per day. Therefore, vehicular delays do not decrease increase. The train delay in minutes per delayed vehicle does not change from 1.2 but and there is no change a decrease in the total number of delayed vehicles from 226 244 and 72, respectively to 217 and 64 and 66 vehicles per day. There is also no change a decrease in the total blocked time for each crossing from 2 26 to 23 minutes per day. The analysis shows that there is no change in crossing criteria; therefore, the current LOS A does not change under the Proposed Action.~~

Richton Park

SEA evaluated one highway/rail at-grade crossing in Richton Park: University Parkway/Stuenkel Road. Under the Proposed Action, daily train traffic through this crossing drops from 13.8 to 12.3 trains. The reduction in train traffic does not reduce delays from 1.5 minutes, but does reduce the total number of delayed vehicles from 244 to 217 per day. The decrease in the number of trains also reduces the total blocked time for the crossing from 26 minutes to 23 minutes per day. The analysis shows that all crossing criteria would improve; therefore, the current LOS A does not change under the Proposed Action.

University Park

SEA evaluated one highway/rail at-grade crossing in University Park: West Dralle Road under the Proposed Action, daily train traffic through this crossing drops from 13.8 to 12.3 trains. The reduction in train traffic does not reduce delays from 1.5 minutes, but does reduce the total number of delayed vehicles from 72 to 64 per day. The decrease in the number of trains also reduces the total blocked time for the crossing from 26 minutes to 23 minutes per day. The analysis shows that all crossing criteria would improve; therefore, the current LOS A does not change under the Proposed Action.

4.4.5.5 Elsdon/Southbend Subdivision

SEA analyzed ~~47~~ 49 highway/rail at-grade crossings along the Elsdon/Southbend Subdivision. Table E1.2-17 shows the results of the delay analysis.

SEA reanalyzed four highway/rail at-grade crossings along the Elsdon/Southbend Subdivision. The range of results from the new data affected three communities. These communities are listed below. The change in the ranges of data are reflected in number of trains (N), vehicular delay in minutes (Da), total delayed vehicles (Td) and total blocked crossing time. Table E1.2-17 shows the results of crossings in the new delay analysis.

Chicago

SEA evaluated nine highway/rail at-grade crossings in Chicago: 55th Street, 71st Street, 79th Street, Columbus Avenue, 83rd Place, 87th Street, 103rd Street, 111th Street and 115th Street. Under the Proposed Action, daily train traffic through these crossings drops from 3.4 (~~3.3~~ no change from 1.6 at 55th Street and 71st Street) to zero trains. Therefore, vehicular delays decrease. The reduction in train traffic reduces delays from 4.4 minutes to zero seconds per delayed vehicle and also reduces the range of total number of delayed vehicles from ~~483~~ 463 to zero per day. The decrease in the number of trains also reduces the total blocked time for each crossing from ~~22 minutes and~~ 23 minutes, ~~respectively,~~ to zero minutes (no change from 11 minutes at 55th and 71st) per day. The analysis shows that all crossing criteria improve; therefore, the current LOS A does not change under the Proposed Action.

The No Action number of daily train traffic decreases to 1.6, from 3.3 that was in the DEIS. The Proposed Action number of daily train traffic increases to 1.6, from 0 that was in the DEIS. The No Action number of delayed vehicles decreases to 234, from 483 that was in the DEIS. The Proposed Action number of delayed vehicles increases to 234, from 0 in the DEIS. The Proposed Action average delay per delayed vehicle increases to 4.4 minutes, from 0 minutes in the DEIS. The No Action total blocked crossing time decreases to 11 minutes, from 22 minutes in the DEIS. The Proposed Action total blocked crossing time increases to 11 minutes, from 0 minutes in the DEIS.

Evergreen Park

SEA evaluated five highway/rail at-grade crossings in Evergreen Park: 91st Street, Kedzie Avenue, 94th Street, 95th Street (US 12/US 20) and 99th Street. Under the Proposed Action, daily train traffic through these crossings drops from 3.4 to zero trains. Therefore, vehicular delays decrease. The reduction in train traffic reduces delays from 4.4 minutes to zero seconds per delayed vehicle and also reduces the range of total number of delayed vehicles from 579 to zero vehicles per day. The decrease in the number of trains also reduces the total blocked time for each crossing from 23 minutes to zero minutes per day. The analysis shows that all crossing criteria improve; therefore, the current LOS A does not change under the Proposed Action.

Blue Island

SEA evaluated four highway/rail at-grade crossings in Blue Island: 119th Street, 123rd Street, 127th Street, and Broadway Street. Under the Proposed Action, daily train traffic through these crossings drops from 3.4 to zero (14.9 to 1 at Broadway Street). Therefore, vehicular delays decrease. The reduction in train traffic reduces delays from 4.4 and ~~1.8~~ 5.7 minutes, respectively, to zero seconds and ~~1.3~~ 4.5 minutes per delayed vehicle and also reduces the total range of delayed vehicles from ~~437~~535 to 29 ~~eight~~ per day. The decrease in the number of trains also reduces the total blocked time for each crossing from 23 minutes to zero minutes (~~42~~ 130 minutes to seven ~~two~~ minutes at Broadway

Street) per day. The analysis shows that all crossing criteria improve; therefore, the current LOS ~~A~~ E does ~~not~~ improve to LOS A ~~change~~ under the Proposed Action.

The No Action number of delayed vehicles increases to 535, from 171 that was in the DEIS. The Proposed Action number of delayed vehicles increases to 29, from 8 in the DEIS. The No Action average delay per delayed vehicle increases to 5.7 minutes, from 1.8 minutes in the DEIS. The Proposed Action average delay per delayed vehicle increases to 4.5 minutes, from 1.3 minutes in the DEIS. The No Action total blocked crossing time increases to 130 minutes, from 42 minutes in the DEIS. The Proposed Action total blocked crossing time increases to 7 minutes, from 2 minutes in the DEIS. The No Action crossing LOS decreases to LOS E, from LOS A in the DEIS.

Dixmoor

SEA evaluated two highway/rail at-grade crossings in Dixmoor: Western Avenue and Robey Street. Under the Proposed Action, daily train traffic through these crossings drops from 14.9 to one train. Therefore, vehicular delays decrease. The reduction in train traffic reduces delays from 2.2 and 1.9 minutes, respectively, to 1.5 and 1.4 minutes per delayed vehicle and also reduces the total number of delayed vehicles from 347 and four, respectively, to 16 and zero per day. The decrease in the number of trains also reduces the total blocked time for each crossing from 50 and 44 minutes, respectively, to two minutes per day. The analysis shows that all crossing criteria improve; therefore, the current LOS A does not change under the Proposed Action.

Harvey

SEA evaluated eight ~~seven~~ highway/rail at-grade crossings in Harvey: Lincoln Avenue, Wood Street, Sibley Boulovard/147th Street (IL 83), Ashland Avenue, Center Avenue, Broadway Avenue, Park Avenue and Halsted Street (IL 1). Under the Proposed Action, daily train traffic through these crossings drops from 14.9 trains to one (19.5 to one at Halsted Street). Therefore, vehicular delays decrease. The reduction in train traffic reduces delays from a range of 1.9 minutes to 1.4 minutes ~~(5.7 to 4.5 minutes at Broadway Street)~~ per delayed vehicle and also reduces the range of total number of delayed vehicles from ~~1,023~~ 990 to ~~49~~ 48 per day. The decrease in the number of trains also reduces the range of total blocked time for each crossing from at most 46 minutes to 2 minutes ~~(130 minutes to seven minutes at Broadway Street)~~ per day. The analysis shows that all crossing criteria would improve; therefore, the current LOS A does not change under the Proposed Action.

~~Proposed Action LOS for Broadway Street improves from LOS E to LOS A. The remaining crossings have no change from LOS A under the Proposed Action.~~

The No Action number of delayed vehicles decreases to 990, from 1023 that was in the DEIS. The Proposed Action number of delayed vehicles decreases to 48, from 49 in the DEIS. The No Action crossing LOS increases to LOS A, from LOS E in the DEIS.

Phoenix

SEA evaluated one highway/rail at-grade crossing in Phoenix: 155th Street. Under the Proposed Action, daily train traffic through this crossing drops from 19.5 to one trains. Therefore, vehicular delays decrease. The reduction in train traffic reduces delays from 1.5 minutes to 1.3 minutes per delayed vehicle and also reduces the total number of delayed vehicles from 14 to one per day. The decrease in the number of trains also reduces the total delayed time for the crossing from 46 minutes to two minutes per day. The analysis shows that all crossing criteria would improve; therefore, the current LOS A does not change under the Proposed Action.

South Holland

SEA evaluated four highway/rail at-grade crossings in South Holland: Thornton-Blue Island Road, 159th Street/162nd Street (US6), South Park Avenue, and 170th Street. Under the Proposed Action, daily train traffic through these crossings drops from 19.5 trains to one (22.1 to 2.9 at South Park Ave and 170th Street). Therefore, some vehicular delays decrease. Vehicular delays increase from 3.3 to 3.5 minutes per delayed vehicle at 170th Street because under the Proposed Action train lengths increase. The reduction in train traffic reduces the range of delays from 2.1 minutes to 1.6 minutes per delayed vehicle and also reduces the range of total number of delayed vehicles from 1,141 to 145 per day. The decrease in the number of trains also reduces the total range of blocked time for each crossing from 70 minutes to 9 minutes per day (113 minutes to 16 minutes at 170th Street). The Proposed Action LOS for South Park Avenue improved from LOS B to LOS A, while LOS for 170th Street improved from LOS C to LOS A. The remaining crossings have no change from LOS A under the Proposed Action.

Lansing

SEA evaluated ~~five~~ six highway/rail at-grade crossings in Lansing: Volbrecht Road, 182nd Street/Ridge Road, Torrence Avenue (IL 83), 186th Street, Burnham Avenue, and Wentworth Avenue. Under the Proposed Action, daily train traffic through these crossings drops from 22.1 to 2.9 trains. Therefore, vehicular delays decrease. The reduction in train traffic reduces delay range from 1.5 minutes to no more than 1.4 minutes per delayed vehicle and also reduces the range of total number of delayed vehicles from 446 to 53 per day. The decrease in the number of trains also reduces the total range of blocked time for each crossing from 51 minutes to six minutes per day. The analysis shows that all crossing criteria improve; therefore, the current LOS A does not change under the Proposed Action.

Near Thornton

SEA evaluated one highway/rail at-grade crossing in Thornton: Thornton-Lansing Road. Under the Proposed Action, daily train traffic through this crossing drops from 22.1 to 2.9 trains. Therefore, vehicular delays decrease. The reduction in train traffic reduces delays from 1.5 minutes to 1.4 minutes per delayed vehicle and also reduces the total number of delayed vehicles from 425 to 51 vehicles per day. The decrease in the number of trains also reduces the total blocked time for the crossing from 51 to six minutes per day. The analysis shows that all crossing criteria improve; therefore, the current LOS A does not change under the Proposed Action.

Munster, Indiana

SEA evaluated two highway/rail at-grade crossings in Munster: Calumet Avenue and White Oak Road. Under the Proposed Action, daily train traffic through these crossings drops from 22.1 to 2.9 trains. Therefore, vehicular delays decrease. The reduction in train traffic reduces delays from 1.4 and 1.5 minutes, respectively, to 1.3 and 1.4 minutes per delayed vehicle and also reduces the total number of delayed vehicles from 1,070 and 394, respectively, to 128 and 48 vehicles per day. The decrease in the number of trains also reduces the total blocked time for each crossing from 49 and 51 minutes to six minutes per day. The analysis shows that all crossing criteria improve; therefore, the current LOS A does not change under the Proposed Action.

Highland, Indiana

SEA evaluated one highway/rail at-grade crossing in Highland: Kennedy Avenue. Under the Proposed Action, daily train traffic through these crossings drops from 22.1 to 2.9 trains. However, vehicular delays increased because under the Proposed Action train lengths increase. The reduction in train traffic and increase in train lengths would increase delays from 2.8 to three minutes per delayed vehicle and also reduce the total number of delayed vehicles from 444 to 62 vehicles per day.

The decrease in the number of trains also reduces the total blocked time for each crossing from 96 minutes to 13 minutes per day. The analysis shows that all crossing criteria improve; therefore, the current LOS C changes to LOS A under the Proposed Action.

Griffith, Indiana

SEA evaluated three highway/rail at-grade crossings in Griffith: Broad Street, Main Street and Colfax Street. Under the Proposed Action, daily train traffic through these crossings drops from 22.1 to 2.9 (~~no change from 23.3~~ 24.8 to 18.6 at Colfax Street) trains. ~~There is no change in vehicular delays~~ Vehicular delays for Main Street do not change from 1.6 minutes per delayed vehicle, while all other crossings increase. ~~The reduction in train traffic does not reduce delays from 1.6 minutes (1.4 minutes at Colfax Street) per delayed vehicle, but does reduce the range of total number of delayed vehicles from 416 to 94 (There is no change from 510 at Colfax Street) vehicles per day~~ The reduction in train traffic also reduces the range of total number of delayed vehicles from 727 to no more than 527 vehicles per day. ~~The decrease in the number of trains did reduce the total blocked time for each crossing from 55 minutes and 53 minutes to seven minutes (no change from 52 minutes in delayed time for Colfax Street) per day~~ The decrease in the number of trains did reduce the total blocked time for each crossing from 55 minutes and 53 minutes to seven minutes (55 minutes to 54 minutes for Colfax Street) per day. ~~The analysis shows that some crossing criteria improve; therefore, the current LOS A does not change under the Proposed Action~~ The analysis shows that some crossing criteria, except for Colfax Street improve; therefore, the current LOS A does not change under the Proposed Action.

Merrillville, Indiana

SEA evaluated three highway/rail at-grade crossings in Merrillville: Taft Street, Madison Street and Broadway Street. Under the Proposed Action, daily train traffic through these crossings ~~does not change~~ drops from 24.8 ~~23.3~~ to 18.6 trains per day. There is no change in vehicular delays. The reduction in train traffic does not reduce delays from 1.4 minutes per delayed vehicle, but does ~~or~~ reduce the range of total number of delayed vehicles from ~~1,098~~ 1,534, ~~325 and 1,441~~ to no more than 1,151 vehicles per day. The decrease in the number of trains ~~did not~~ reduced the total blocked time for each crossing from ~~52~~ 55 minutes to 41 minutes per day. The analysis shows no change in crossing criteria; therefore, the current LOS A does not change under the Proposed Action.

TABLE E1.2-17. ELSDON/SOUTHBEND SUBDIVISION, CN HIGHWAY/RAIL AT-GRADE CROSSING VEHICLE DELAY DATA

Street	2015 ADT	Trains per Day, N		Train Speed, V		Average Delay per Delayed Vehicle, D_a		Total Delayed Vehicles per day, T_d		Number of Vehicles Queued, Q		Crossing LOS		Total Blocked Crossing Time (24-Hr), Minutes		Percent Change Total Blocked Crossing Time per 24-Hr

General Mobility of Roadways near Highway/Rail At-Grade Crossings

As stated in Chapter 4, SEA evaluated the operations of the roadways that cross the EJ&E rail line and the CN subdivisions independently of rail line crossing operations. The purpose of the additional evaluation was to identify operations on roadways crossing the railways in two ways: 1) to identify and evaluate roadways that, under the Proposed Action, would operate at or over capacity (LOS E-F), and 2) to evaluate effects of the Proposed Action on the overall mobility of each community, including impacts to roadways near the rail lines.

SEA estimated traffic volumes for 2015 by applying a growth rate to the 2007 roadway volumes. The growth rate was developed based on the assumptions stated in Table 4.3-2. The LOS methodology discussed in Chapter 4 has been assumed for the analysis of the 2015 conditions. SEA also reviewed local and regional transportation plans to account for future roadway changes and upgrades.

Planned or programmed improvements in the community's roadway network were identified and incorporated in the future condition analysis. Metra commuter rail lines cross the EJ&E rail line and CN subdivisions, and some of them are rail/rail at-grade crossings within the communities discussed below. At-grade interactions between freight and commuter services may increase because Metra plans to expand commuter rail service along the majority of the rail lines. This expansion would include service during the peak and off-peak periods as well as reverse commute service. The interaction between freight and commuter rail lines may result in the commuter rail service being given priority over the freight service using EJ&E rail lines.

The sections below present the analysis results, listed by railway line. LOS analysis results and overall mobility conditions, which include network connectivity, potential queuing issues associated with the railway crossings, and Metra commuter rail impacts are provided first for the EJ&E rail line, and then for the five CN subdivisions.

EJ&E Rail Line Evaluation

The first step in assessing the effects of the Proposed Action on 2015 roadway conditions was to identify the highway/rail at-grade crossings along the EJ&E rail line that meet the Board's analysis thresholds, and to identify the communities in which those crossings are located. Then, SEA calculated the 2015 roadway LOS for each intersecting roadway. The LOS and vehicle queue length results for each EJ&E highway/rail at-grade crossing location are contained in Tables E1.2-19 through E1.2-24, respectively. Roadways with an LOS E or LOS F were designated as critical, while roadways with a LOS A-D provide an acceptable level of service. Based on the LOS and vehicle queue length results, SEA evaluated the 2015 roadway network and overall mobility in the vicinity of each of the critical roadways. The narratives below discuss the 2015 conditions of the roadway networks in the vicinity of the highway/rail at-grade crossings within each community, including the network connectivity and vehicle queue lengths associated with critical crossings. The vehicle queue lengths were calculated for the No-Action and the Proposed Action. The narratives identify only the vehicle queue lengths that would block a major roadway, in turn affecting the community's level of overall mobility.

The evaluation summary has been divided into sections that summarize each community located along the EJ&E rail line. Table E1.2-18 provides a summary of the resulting 2015 roadway LOS by county for all public highway/rail at-grade crossings that meet the evaluation thresholds of 2,500 or more ADT or less than 800 feet between crossings.

The new analysis resulted in several changes in LOS for the EJ&E rail line. Below is a summary of those changes for the 2015 roadway LOS analysis.

Table E1.2-18. 2015 LOS Summary Of Roadways Crossing The EJ&E Rail Line												
LOS	Total		Lake (Illinois)		Cook		DuPage		Will		Lake (Indiana)	
	2007	2015	2007	2015	2007	2015	2007	2015	2007	2015	2007	2015
LOS A - B	37	29	3	4	7	7	4	2	17	12	6	4
LOS C - D	33	29	5	2	6	6	3	4	14	13	5	4
LOS E - F	17	29	4	6	3	3	4	5	2	8	4	7

As indicated in the table above, the number of roadways that would meet or exceed capacity would almost double from 2007 to 2015 due to the increased roadway volume.

SEA evaluated a total of 88 highway/rail at-grade crossings. The results of delay calculations for all of the crossings are summarized in Tables E1.2-1 and E1.2-2.

Lake County, Illinois

Mundelein - No-Action

Mundelein has two roadways that cross the EJ&E rail line at-grade. Diamond Lake Road, a two-lane collector, runs north/south crossing the EJ&E rail line south of the village center. IL 60/IL 83, a two-lane arterial, runs east/west crossing the EJ&E rail line south of the village center.

Diamond Lake Road would operate at LOS C-D with IL 60/IL 83 operating at LOS E-F. According to the 2020 Lake County Transportation Priority Plan, IL 60/IL 83 widens from two to four lanes. Lake County does not plan to change the alignment or its classification as an arterial. Widening IL 60/IL 83 helps alleviate congestion at the crossing by improving the LOS to C-D.

IL 60/IL 83 is the only roadway that has queue lengths that would block a major roadway under the No-Action Alternative. For the peak period, IL 60/IL 83 could experience a calculated queue length of approximately ~~1,205~~ 590 feet, blocking one major roadway, Diamond Lake Road.

~~With the planned improvements, IL 60/83 would experience a calculated queue length of approximately 1,215 feet, blocking Diamond Lake Road.~~

With the~~se~~ planned improvements, the roadway network in the vicinity of the crossings would operate at an acceptable level of service.

- IL 60/83 No Action queue length changes from 1,205 feet to 590 feet. IL 60/83 Proposed Action queue length changes from 1,215 feet to 1,000 feet. Both the No Action queue length and the No Action queue length block Diamond Lake Road, a major cross street east of the crossing. Therefore, IL 60/IL 83 would experience moderate effects due to the Proposed Action.
- Diamond Lake Road No Action queue length changes from 385 to 265 feet. Lake Road Proposed Action queue length changes from 785 to 470 feet. The Proposed Action queue lengths block IL 60/83, a major cross street east of the crossing not blocked by the No Action queue length. Therefore, Diamond Lake Road experiences a significant impact due to the Proposed Action.

Mundelein - Proposed Action

During the peak period under the Proposed Action, IL 60/IL 83 would experience a calculated vehicle queue length of approximately ~~1,215~~ 1,000 feet, compared to ~~600~~ 590 feet for the No-Action Alternative. Both the No-Action and Proposed Action queuing of IL 60/IL 83 would block a major roadway, Diamond Lake Road. Therefore, IL 60/IL 83 would experience moderate effects due to the Proposed Action.

During the peak period under the Proposed Action, Diamond Lake Road would experience a calculated queue length of approximately ~~785~~470 feet, compared to ~~385~~ 265 feet for the No-Action Alternative. The Proposed Action conditions would block one major roadway, IL 60/IL 83, which is not blocked under the No-Action Alternative. Therefore, Diamond Lake Road experiences a significant impact due to the Proposed Action.

In Mundelein community near the at-grade crossings of IL 83 and Diamond Lake Road, the diverted traffic may travel on Elmwood Avenue/Lake View Avenue west of Diamond Lake Road and on West Hickory Street to the east of Diamond Lake Road to get to the grade-separated crossing on US 45. These roadways are two lanes with residences fronting on it, which is a configuration not conducive of additional through traffic.

A similar situation may occur in the Richton Park community, where IL 50 crosses the EJ&E line at-grade; however, a grade-separate crossing exists on each side of IL 50. These crossings are in close proximity to IL 50, but to get to these crossing on the south side of the rail line the diverted traffic would be required to travel on local residential streets that are not designed to accommodate the additional traffic.

Hawthorn Woods – No-Action

Hawthorn Woods has two roadways that cross the EJ&E rail line at-grade. Gilmer Road, a two-lane arterial, runs north/south crossing the EJ&E rail line northeast of the village center. Old McHenry Road, a four-lane divided arterial, runs east/west crossing the EJ&E rail line east of the village center.

Gilmer Road and Old McHenry Road would operate at LOS E-F and experience a calculated queue length that blocks no major roadways.According to the Village of Hawthorn Woods Comprehensive Plan 2004 and the 2020 Lake County Transportation Priority Plan, Gilmer Road widens from a two-lane arterial to a four-lane arterial that runs north/south crossing the EJ&E rail line northeast of the village center. The planned improvements to Gilmer Road help alleviate congestion at the crossing by improving the LOS from E-F to C-D.

With Gilmer Road and Old McHenry Road experiencing an LOS E-F, the roadway network in the vicinity of the crossings would operate at an unacceptable level of service.

Hawthorn Woods – Proposed Action

During the peak period under the Proposed Action, Old McHenry Road would experience a calculated queue length of approximately 1,190 feet compared to 645 feet for the No-Action Alternative. The Proposed Action conditions would block one major roadway, Midlothian Road, which is not blocked under the No-Action Alternative. Therefore, Old McHenry Road experiences a significant impact due to the Proposed Action ~~no major intersecting roadways would be blocked by queued vehicles at the crossings. The overall mobility effect of the Proposed Action would be minimal.~~

- Old McHenry Road would experience a calculated Proposed Action queue length of approximately 1,190 feet compared to 645 feet for the No-Action Alternative. The Proposed Action conditions would block one major roadway, Midlothian Road, which is not blocked under the No-Action Alternative. Therefore, Old McHenry Road experiences a significant impact due to the Proposed Action. The DEIS did not identify Old McHenry Road as a significantly affected crossing.

Lake Zurich - No-Action

Lake Zurich has four roadways that cross the EJ&E rail line at-grade and two grade-separated crossings. Oakwood Road, a two-lane collector, runs north/south crossing the EJ&E rail line north of the village center. Main Street, a two-lane arterial, runs east/west crossing the EJ&E rail line east of the village center. Old Rand Road, a two-lane arterial, runs east/west crossing the EJ&E rail line south of the village center. Ela Road, a two-lane arterial, runs north /south crossing the EJ&E rail line south of the village center.

Oakwood Road, ~~and~~ Old Rand Road and Main Street would operate at LOS A-B ~~C-D~~ while ~~Main Street and~~ Ela Road operates at LOS E-F.

Under the No-Action Alternative, Old Rand Road and ~~Old Rand~~ Ela Road ~~is~~ both have queue lengths ~~the only roadway~~ that blocks major roadways because of No-Action queue lengths. During the peak period, Old Rand Road would experience a calculated queue length of approximately 305 feet, blocking one major roadway, IL 22. Ela Road would experience a calculated queue length of

approximately 780 feet, blocking one major roadway, South Rand Road (US 12) ~~Old Rand Road would experience a calculated queue length of approximately 435 feet, blocking one major roadway, IL 22~~.

According to the 2020 Lake County Transportation Priority Plan, Ela Road widens from two lanes to four lanes. Lake County does not plan to change the alignment or its classification as an arterial. Widening Ela Road helps alleviate congestion at the crossing by improving the LOS to C-D.

A bypass route for IL 22 has recently been constructed that runs north/south providing a four-lane grade-separated crossing south of the village center. This bypass connects to Main Street and may alleviate congestion and queuing at this crossing. With the implementation of planned improvements and the availability of a viable alternative route, the roadway network would operate at an acceptable level of service.

For the No Action alternative, Oakwood Road, Old Rand Road and Main Street would operate at LOS A-B while Ela Road operates at LOS E-F. Main Street operated at E-F in the DEIS.

Under the No-Action Alternative, Old Rand Road and Ela Road both have queue lengths that block major roadways because of No-Action queue lengths. During the peak period, Old Rand Road would experience a calculated queue length of approximately 305 feet, blocking one major roadway, IL 22. Ela Road would experience a calculated queue length of approximately 780 feet, blocking one major roadway, South Rand Road (US 12). Ela Road No Action DEIS queue length is 775 feet.

Lake Zurich - Proposed Action

Under the Proposed Action, no major intersecting roadways would be blocked by queued vehicles at the Oakwood Road ~~and Main Street~~ crossing~~s~~. Therefore, Oakwood Road ~~and Main Street~~ would experience minimal effects due to the Proposed Action.

During the peak period under the Proposed Action, Old Rand Road would experience a calculated vehicle queue length of approximately ~~800~~565 feet, compared to ~~435~~ 305 feet for the No-Action Alternative. Both the No-Action and the Proposed Action queuing of Old Rand Road would block one major roadway, IL 22. Therefore, Old Rand Road would experience moderate effects due to the Proposed Action.

During the peak period under the Proposed Action, Ela Road would expense a calculated queue length of approximately ~~900~~ 1,425 feet, compared to ~~520~~ 780 feet for the No-Action Alternative. Both the No-Action and Proposed Action queuing of Ela Road would block one major roadway, South Rand Road (US 12). Therefore, Ela Road would experience moderate effects due to the Proposed Action.

During peak period under the Proposed Action, Main Street would experience a calculated queue length of approximately 580 feet, compared to 310 feet for the No-Action Alternative. The Proposed Action conditions would block two major roadways, Church Street and IL 22, which are not blocked under the No-Action Alternative. Therefore, Main Street experiences a significant impact due to the Proposed Action.

During the Proposed Action, Old Rand Road queue length changes from 550 to 565 feet. Both the No Action queue length and the Proposed Action queue length blocks IL 22, a major cross street east of the crossing. Therefore, Old Rand Road would experience moderate effects due to the Proposed Action.

During the Proposed Action, Ela Road queue length changes from 950 feet to 1,425 feet. Both the No Action queue length and the Proposed Action queue length blocks South Rand Road (US 12). Therefore, Ela Road would experience moderate effects due to the Proposed Action.

During peak period under the Proposed Action, Main Street would experience a calculated queue length of approximately 580 feet, compared to 310 feet for the No-Action Alternative. The Proposed Action conditions would block two major roadways, Church Street and IL 22, which are not blocked under the No-Action Alternative. Therefore, Main Street experiences a significant impact due to the Proposed Action.

Barrington - No-Action

Barrington has six roadways that cross the EJ&E rail line at-grade. Cuba Road, a four-lane undivided arterial, runs east/west crossing the EJ&E rail line north of the village center. Lake Zurich Road, a two-lane collector, runs north/south crossing the EJ&E rail line east of the village center. Northwest Highway, a four-lane arterial, runs northwest/southeast crossing the EJ&E rail line north of the village center. Hough Street (IL 59/IL 63),a two-lane divided arterial, runs north/south crossing the EJ&E rail line north of the village center. Lake Cook Road, a two-lane arterial, runs east/west crossing the EJ&E rail line south of the village center. Penny Road, a two-lane collector, runs east/west crossing the EJ&E rail line south of the village.

Lake Zurich Road and Penny Road would operate at LOS A-B while Cuba Road at LOS C-D. Northwest Highway, Hough Street (IL 59/IL 63), and Lake Cook Road would operate at LOS E-F.

During the peak periods under the No-Action Alternative, no major intersecting roadways would be blocked by the queued vehicles at the crossings.

According to the 2020 Lake County Transportation Priority Plan, Cuba Road widens from two to four lanes. Widening Cuba Road helps alleviate congestion at the crossing by improving the LOS to A-B. In addition, Cuba Road parallels Lake Cook Road approximately 1.5 miles to the north, and may provide the available capacity to be a viable alternative route to the congested Lake Cook Road.

The village and IDOT are studying the possibility of an IL 59 bypass around the village. This project would occur later than 2015; however, it still helps to alleviate the congestion within the village core. With Northwest Highway, Hough Street (IL 59/IL 63), and Lake Cook Road experiencing an LOS of E-F, even with improvements to Cuba Road, the roadway network in the vicinity of the crossings would operate at an unacceptable level of service.

Barrington - Proposed Action

Under the Proposed Action, Hough Street (IL 59/IL 63) ~~is the only roadway that has~~ and Penny Road have queue lengths that would block a major roadway. During the peak period, Hough Street (IL 59/IL 63) would experience a calculated vehicle queue length of approximately ~~1,500~~ 1,405 feet, compared to ~~810~~760 feet for the No-Action conditions. The Proposed Action queuing of Hough Street (IL 59/IL 63) would block one major roadway, Northwest Highway, which is not blocked under the No-Action Alternative. Hough Street (IL 59/IL 63) would experience significant impacts due to the Proposed Action. During the peak period, Penny Road would experience a calculated vehicle queue length of approximately 315 compared to 170 feet for the No-Action Alternative. The proposed action queuing of Penny Road would block one major roadway, IL 59, which is not blocked under the No-Action Alternative. Therefore, Penny Road would experience significant impacts due to the Proposed Action.

Under the Proposed Action, Hough Street (IL 59/IL 63) is the only roadway that has and Penny Road has queue lengths that would block a major roadway. Hough Street No Action queue length changes from 810 feet to 760 feet. The Proposed Action queuing of Hough Street (IL 59) would block one major roadway, Northwest Highway, which is not blocked under the No-Action Alternative. Hough Street (IL 59/) would experience significant impacts due to the Proposed Action.

Table E1.2-19 summarizes the results of the Lake County, Illinois analysis.

TABLE E1.2-19. HIGHWAY/RAIL AT-GRADE CROSSING VEHICLE DELAY FOR NO-ACTION AND PROPOSED ACTION CONDITIONS (YEAR 2015)

County	Street	2015 ADT	Roadway LOS	Queue Length	
				No-Action	Proposed Action
Lake	Diamond Lake Road	6,207	C	265	466
Lake	IL 60&83	29,009	F	590	1,061
Lake	Gilmer Road	18,622	F	719	1,328
Lake	Old McHenry Road	32,429	F	41	1,186
Lake	Oakwood Road	4,750	B	197	367
Lake	Main Street	7,474	B	310	577
Lake	Old Rand Road	7,474	B	303	561
Lake	Ela Road	21,408	F	776	1,421
Lake	Cuba Road	12,921	D	443	804
Lake	Lake Zurich Road	3,131	A	102	187
Lake	Northwest Highway	33,949	E	562	1,057
Lake	Hough Street IL 59&63	22,549	F	760	1,404

Western Cook County

Hoffman Estates - No-Action

Hoffman Estates has one roadway that crosses the EJ&E rail line at-grade and two that have grade-separated crossings. Shoe Factory Road, a two-lane collector, runs east/west crossing the EJ&E rail line west of the village center.

Shoe Factory Road would operate at LOS C-D and experience a calculated queue length that would block no major roadways. The roadway network in the vicinity of the crossing would operate at an acceptable level of service.

Hoffman Estates - Proposed Action

During the peak period under Proposed Action conditions, no major intersecting roadways would be blocked by queued vehicles at the crossing. The overall mobility effect of the Proposed Action would be minimal.

Elgin - No-Action

Elgin has one roadway that crosses the EJ&E rail line at-grade and three that have grade-separated crossings. West Bartlett Road is a collector that runs east/west crossing the EJ&E rail line south of the city. The roadway is a two-lane collector west of the crossing and a four-lane roadway east of the crossing.

West Bartlett Road would operate at LOS ~~C-D~~ E-F.

During the peak periods under the No-Action Alternative, no major intersecting roadways would be blocked by the queued vehicles at the crossings.

According to the Cook County Highway Department's Highway Transportation Plan project list for 2008, West Bartlett Road widens to a four-lane divided roadway between Spitzer Road and IL 59, east of the EJ&E crossing. However, the West Bartlett Road Corridor Plan conducted by the Village of Bartlett suggests that Cook County would facilitate the widening of West Bartlett Road to the EJ&E railroad, with construction of a new at-grade crossing. Without these planned improvements, West Bartlett Road would operate at LOS E-F.

The Cook County Highway Transportation Plan and the Village of Bartlett's West Bartlett Road Corridor Plan recommend upgrading West Bartlett Road to a four-lane divided facility with a new at-grade crossing at the intersection with the EJ&E railroad.

With the proposed improvements, the roadway network would operate at an acceptable level of service.

- West Bartlett Road LOS changes from LOS C-D to LOS E-F.

Elgin - Proposed Action

During the peak period under the Proposed Action, no major intersecting roadways would be blocked by queued vehicles at the crossings. The overall mobility effect of the Proposed Action would be minimal.

Table E1.2-20 summarizes the results of the Western Cook County, Illinois analysis.

TABLE E1.2-20. HIGHWAY/RAIL AT-GRADE CROSSING VEHICLE DELAY FOR NO-ACTION AND PROPOSED ACTION CONDITIONS (YEAR 2015)

County	Street	2015 ADT	Roadway LOS	Queue Length	
				No-Action	Proposed Action
Cook	Lake Cook Road	14,222	F	479	885
Cook	Penny Road	4,786	B	170	311
Cook	Shoe Factory Road	9,202	D	334	598
Cook	West Bartlett Road	17,209	F	587	978

Du Page County, Illinois

Bartlett - No-Action

Bartlett has one roadway that crosses the EJ&E rail line at-grade. Stearns Road is a four-lane divided arterial that runs east/west crossing the EJ&E rail line west of the village center. The Metra MD-W commuter rail line has an at-grade crossing with the EJ&E rail line within the community.

The CC&P/Stearns Road Corridor Design Report identifies the realignment of Stearns Road. McDonald Road would be extended from the west with a new bridge over the Fox River and connecting to the new Stearns Road alignment. This new bridge and realignment will result in an increase of the projected traffic volumes on Stearns Road. The construction is scheduled to be complete by 2010. Stearns Road would operate at LOS ~~C-D~~ E-F and experience a calculated queue length that would block no major roadways during the peak periods under the No-Action conditions.

The roadway network in the vicinity of the crossing would operate at an acceptable level of service.

- Stearns Road roadway LOS changes from LOS C-D to LOS E-F.

Bartlett - Proposed Action

During the peak period under the Proposed Action, no major intersecting roadways would be blocked by queued vehicles at the crossing. The overall mobility effect of the Proposed Action would be minimal.

Wayne - No-Action

Wayne has one roadway that crosses the EJ&E rail line at-grade. Army Trail Road, a two-lane arterial, runs east/west crossing the EJ&E rail line north of the village center.

Army Trail Road would operate at LOS C-D. During the peak period under No-Action conditions, no major intersecting roadways would be blocked by the queued vehicles at the crossings.

The roadway network in the vicinity of the crossing would operate at an acceptable level of service.

Wayne - Proposed Action

During the peak period under the Proposed Action, no major intersecting roadways would be blocked by queued vehicles at the crossing. The overall mobility effect of the Proposed Action would be minimal.

West Chicago - No-Action

West Chicago has five roadways that cross the EJ&E rail line at-grade and two grade-separated crossings. Smith Road, a two-lane collector, runs east/west crossing the EJ&E rail line north of the city center. Hawthorne Lane, a two-lane collector, runs east/west crossing the EJ&E rail line north of the city center. Washington Street, a two-lane arterial, runs east/west crossing the EJ&E rail line north of the city center. Aurora Street, a two-lane collector, runs north/south crossing the EJ&E rail line north of the city center. Church Street, a two-lane collector, runs east/west crossing the EJ&E rail line north of the city center. The Metra UP-W commuter rail line has an at-grade crossing with the EJ&E rail line within the community.

Smith Road~~, Hawthorne Lane,~~ and Washington Street would operate at LOS C-D while Aurora Street and Church Street would operate at LOS A-B. Hawthorne Lane would operate at LOS E-F.

During the peak period under the No-Action Alternative, no major intersecting roadways would be blocked by queued vehicles at the crossings.

According to DuPage County and IDOT plans, no local improvements are planned for Smith Road. In addition, the City of West Chicago, DuPage County, and IDOT do not identify improvements for Washington Street, Aurora Street, or Church Street. However, West Chicago's public works department identifies current construction along Hawthorne Lane in the vicinity of the EJ&E crossing. This project includes upgrading Hawthorne Lane from a rural two-lane section to an urban three-lane section and is scheduled for completion in 2008. The addition of a two-way left-turn lane improves operations in the vicinity of the crossing by removing left-turns from through traffic along the corridor; however, it is not expected to significantly improve level of service or queuing at the railroad crossing. With the key streets operating above capacity, the overall level of mobility for local traffic in the West Chicago community would be unacceptable. However, the availability of a grade-separated crossing along North Avenue (IL 64) may provide relief by removing the through traffic from the congested roadways.

- Hawthorn Lane roadway LOS changes from LOS C-D to LOS E-F.

West Chicago – Proposed Action

During the peak period under the Proposed Action, no major intersecting roadways would be blocked by queued vehicles at the crossings. The overall mobility effect of the Proposed Action would be minimal.

Naperville – No-Action

Naperville has one roadway that cross the EJ&E rail line at-grade and two grade-separated crossings. Diehl Road, a four-lane arterial, runs east/west crossing the EJ&E rail line north of the village center.

Diehl Road would operate at LOS C-D. During the peak period under the No-Action Alternative, no major intersecting roadways would be blocked by the queued vehicles at the crossings.

The roadway network in the vicinity of the crossing would operate at an acceptable level of service.

Naperville – Proposed Action

During the peak period under the Proposed Action, no major intersecting roadways would be blocked by queued vehicles at the crossing. The overall mobility effect of the Proposed Action would be minimal.

Aurora – No-Action

Aurora has three roadways that cross the EJ&E rail line at-grade and three that have grade-separated crossings. Liberty Street runs east/west crossing the EJ&E rail line; it is a two-lane undivided arterial west of the EJ&E crossing and a four-lane divided arterial east of the crossing. Ogden Avenue (US 34) is a four-lane divided arterial that runs east/west crossing the EJ&E rail line east of the city center. Montgomery Road, a two-lane collector, runs east/west crossing the EJ&E rail line east of the city center.

Liberty Street, Ogden Avenue, and Montgomery Road would operate at LOS E-F. New York Street parallels Liberty Street and provides a grade-separated crossing of the EJ&E rail line approximately 0.5 mile south of Liberty Street, providing a potential alternative route to the congested Liberty Street. McCoy Drive parallels Ogden Avenue (US 34) and provides a grade-separated crossing of the EJ&E rail line approximately 0.7 mile north of Ogden Avenue (US 34), providing a potential alternative route to the congested Ogden Avenue (US 34).

During the peak periods under the No-Action Alternative, no major intersecting roadways would be blocked by queued vehicles at the crossings.

According to DuPage County and IDOT plans, no local roadway improvements are planned for Liberty Street. However, the DuPage County Comprehensive Roadway Plan does identify the need to upgrade intersections along Ogden Avenue (US 34) in the vicinity of the EJ&E crossing. These improvements may improve operations along the roadway, but would not provide additional roadway capacity at the crossing location. DuPage County and IDOT do not currently have plans to upgrade Montgomery Road near the railroad crossing. The City of Aurora Comprehensive Plan identifies a potential extension of US 30 to create a bypass route south of the city. This bypass route would run east/west approximately 1.5 miles south of Montgomery Road and could possibly alleviate congestion along parallel routes. With the key streets operating above capacity, the overall level of mobility for the Aurora community would be unacceptable; however, the availability of alternative, grade-separated routes, along with a planned bypass to the south, may provide a much-needed relief by removing traffic from the congested roadways.

Aurora – Proposed Action

During the peak periods under the Proposed Action, no major intersecting roadways would be blocked by queued vehicles at the crossings. The overall mobility effect of the Proposed Action would be minimal.

Table E1.2-21 summarizes the results of the DuPage County, Illinois analysis.

TABLE E1.2-21. HIGHWAY/RAIL AT-GRADE CROSSING VEHICLE DELAY FOR NO-ACTION AND PROPOSED ACTION CONDITIONS (YEAR 2015)

County	Street	2015 ADT	Roadway LOS	Queue Length	
				No-Action	Proposed Action
DuPage	Stearns Road	27,604	E	486	815
DuPage	Army Trail Road	7,392	C	224	452

DuPage	Montgomery Road	27,131	F	1,274	1,597

Will County, Illinois

Plainfield - No-Action

Plainfield has 14 roadways that cross the EJ&E rail line at-grade and two grade-separated crossings. Hafenrichter Road, a two-lane collector, runs east/west crossing the EJ&E rail line north of the village. Wolf's Crossing Road, a two-lane collector, runs east/west crossing the EJ&E rail line north of the village. 111th Street, a two-lane collector, runs east/west crossing the EJ&E rail line north of the village. 119th Street, a two-lane collector, runs east/west crossing the EJ&E rail line north of the village. 127th Street, a two-lane collector, runs east/west crossing the EJ&E rail line north of the village. 135th Street, a two-lane collector, runs east/west crossing the EJ&E rail line north of the village. Van Dyke Road, a two-lane collector, runs north/south crossing the EJ&E rail line north of the village center. 143rd Street, a two-lane collector, runs east/west crossing the EJ&E rail line north of the village center. Naperville Road, a two-lane undivided arterial, runs northeast/southwest crossing the EJ&E rail line north of the village center. Main Street (IL 126) is a two-lane undivided arterial that runs southwest/northeast crossing the EJ&E rail line east of the village center. Center Street, a two-lane collector, runs north/south crossing the EJ&E rail line east of the village center. Eastern Avenue, a two-lane collector, runs north/south crossing the EJ&E rail line east of the village center. Lockport Road, a two-lane collector, runs east/west crossing the EJ&E rail line south of the village center. Renwick Road is a two-lane undivided arterial that runs east/west crossing the EJ&E rail line south of the village center.

Naperville Road, Center Street, ~~and~~ Eastern Avenue, and 119th Street would operate at LOS A-B. Hafenrichter Road, ~~119th Street, 127th Street,~~ Wolf's Crossing Road, Van Dyke Road, 143rd Street, and Renwick Road would operate at LOS C-D. 127th Street, ~~Wolf's Crossing Road,~~ 111th Street, 135th Street, Main Street (IL 126), and Lockport Road would operate at LOS E-F.

Under the No-Action Alternative, Main Street (IL 126) and 127th Street are the only roadways that have queue lengths that would block a major roadway. 127th Street would experience a calculated queue length of approximately ~~325~~665 feet, blocking one major roadway, US 30. Main Street (IL 126) would experience a calculated queue length of approximately ~~910~~820 feet, blocking one major roadway, Division Street (IL 59).

According to the Village of Plainfield Comprehensive Plan Update and the Will County 2020 Transportation Framework Plan, 119th Street widens from two to four lanes. Widening 119th Street helps alleviate congestion at the crossing by improving the LOS to A-B.

According to the Village of Plainfield Comprehensive Plan Update, 143rd Street widens from a two-lane collector to a five-lane arterial. The plan also calls for extending 143rd Street to connect adjacent arterials and function as a primary truck route around the village. Widening 143rd Street helps alleviate congestion at the crossing by improving the LOS to A-B.

According to the Village of Plainfield Comprehensive Plan Update and the Will County 2020 Transportation Framework Plan, Renwick Road upgrades from a two-lane undivided arterial to a four-lane divided arterial. Widening Renwick Road helps alleviate congestion at the crossing by improving the LOS to A-B.

The Will County 2020 Transportation Framework Plan and the City of Aurora Comprehensive Plan identify the future extension of 95th Street to US 30, parallel to Wolf's Crossing Road, approximately 2,100 feet to the north. In addition, the Village of Plainfield Comprehensive Plan Update suggests closing the connection between Naperville Road and Division Street (IL 59) and re-routing traffic to Main Street (IL 126) east of the EJ&E crossing. Naperville Road would be upgraded north of this re-alignment from a two-lane arterial to a three or four-lane section. The Village of Plainfield Comprehensive Plan Update also recommends improving Main Street (IL 126) to accommodate bicycles and pedestrians, but no capacity upgrades are planned. The plan does suggest re-assigning IL 126 north to 143rd Street to remove through and truck traffic from the village core. Upgrades to Ferguson Road/119th Street, 143rd Street, and Renwick Road, all approximately 1 mile south of 111th Street, 135th Street, and Lockport Road, respectively, may provide the available capacity to be viable alternative routes for the congested roadways.

In addition to the above-mentioned improvements, the Village of Plainfield Comprehensive Plan Update and the Will County 2020 Transportation Framework Plan also recommend upgrading US 30 from a two-lane undivided arterial to a four-lane divided arterial in the vicinity of the EJ&E railroad. This improvement could provide increased mobility in and around the Plainfield community.

Even with proposed improvements, the roadway network in the vicinity of the crossings would operate at an unacceptable level of service.

Plainfield - Proposed Action

The mobility effects of the Proposed Action would be minimal on all roadways except 127th Street, 135th Street, and Main Street (Il 126):

- 127th Street would experience a calculated queue length of approximately ~~425~~870 feet, compared with ~~325~~ 665 feet under the No-Action Alternative. Both the Proposed Action and No-Action alternatives block one major roadway, US 30.

- Main Street (IL 126) would experience a calculated queue length of approximately ~~910~~ 1,085 feet, compared with ~~1,200~~ 820 feet under the No-Action Alternative. Both the Proposed Action and No-Action alternatives block one major roadway, Division Street (IL 59). Both 127th Street and Main Street would experience moderate effects due to the Proposed Action.
- 135th Street would experience a calculated queue length of approximately ~~725~~855 feet, compared with ~~540~~ 640 feet under the No-Action Alternative. The Proposed Action would block one major roadway, US 30, which is not blocked under the No-Action Alternative. 135th Street would experience a significant impact due to the Proposed Action
- Naperville Road would experience a calculated queue length of approximately 440 feet, compared with 335 feet under the No-Action Alternative. The Proposed Action would block one major roadway, Division Street (IL 59). Both Naperville Road and 135th Street would experience a significant impact due to the Proposed Action.
- 119th Street roadway LOS changes from LOS C-D to LOS A-B.
- 127th Street roadway LOS changes from LOS C-D to LOS E-F.
- 127th Street No Action queue length changes from 325 feet to 665 feet, blocking one major roadway, US 30. 127th Street Proposed Action queue length changes from 425 feet to 870 feet. Both the Proposed Action and No-Action alternatives block one major roadway, Division Street (IL 59). 127th Street would experience moderate effects due to the Proposed Action
- Main Street No Action queue length changes from 910 feet to 1,085 feet. Main Street Proposed Action queue length changes from 1,200 feet to 820 feet. Both the Proposed Action and No-Action alternatives block one major roadway, Division Street (IL 59). Main Street would experience moderate effects due to the Proposed Action
- 135th Street No Action queue length changes from 725 feet to 825 feet. 135th Proposed Action queueu length changes from 540 feet to 640 feet. Both the Proposed Action and No-Action alternatives block one major roadway, Division Street (IL 59). 135th Street would experience moderate effects due to the Proposed Action.
- Naperville Road No Action queue length changes from 335 feet to 440 feet. Naperville Road Proposed Action queue length changes from 250 feet to 335 feet. The Proposed Action would block one major roadway, Division Street (IL 59), which is not blocked under the No-Action Alternative. Naperville Road would experience a significant impact due to the Proposed Action.

Crest Hill - No-Action

Crest Hill has three roadways that cross the EJ&E rail line at-grade and three that have grade-separated crossings. Essington Road, a two-lane collector, runs north/south crossing the EJ&E rail line north of the village center. Division Street, a four-lane collector, runs east/west crossing the EJ&E rail line north of the village center. Gaylord Road, a two-lane collector, runs north/south crossing the EJ&E rail line south of the village center.

Essington Road, and Division Street would operate at LOS A-B while Gaylord Road would operate at LOS C-D.

During the peak period under the No-Action Alternative, no major intersecting roadways would be blocked by the queued vehicles at the crossings.

With the availability of multiple at-grade and grade-separated crossings operating below capacity, the roadway network in the vicinity of the crossings would operate at an acceptable level of service.

Crest Hill - Proposed Action

Crest Hill has three roadways that cross the EJ&E rail line at-grade and three grade-separated crossings. Essington Road, a two-lane collector, runs north/south crossing the EJ&E rail line north of the village center. Division Street is a four-lane collector that runs east/west crossing the EJ&E rail line north of the village center. Gaylord Road, a two-lane collector, runs north/south crossing the EJ&E rail line south of the village center.

During the peak period under the Proposed Action, no major intersecting roadways would be blocked by queued vehicles at the crossings. The overall mobility effect of the Proposed Action would be minimal.

Joliet - No-Action

Joliet has five roadways that cross the EJ&E rail line at-grade and five that have grade-separated crossings. Woodruff Road, a two-lane collector, runs east/west crossing the EJ&E rail line north of the city center. Washington Street, a two-lane undivided arterial, runs east/west crossing the EJ&E rail line east of the city center. Briggs Street, a two-lane undivided arterial, runs north/south crossing the EJ&E rail line east of the city center. Rowell Avenue, a two-lane collector, runs north/south crossing the EJ&E rail line twice east of the city center. Mills Road, a two-lane undivided arterial, runs east/west crossing the EJ&E rail line south of the city center.

Rowell Avenue and Mills Road would operate at LOS A-B, Washington Street would operate at LOS C-D. Woodruff Road and Briggs Street would operate at LOS E-F. Charlesworth Avenue provides a grade-separated crossing approximately 1,200 feet southeast of the Woodruff Road crossing.

Under the No-Action Alternative, Briggs Street is the only roadway that has queue lengths that would block a major roadway. During the peak period under the No-Action Alternative, the queue length along Briggs Street would be approximately 655 feet, which would block one major street, Manhattan Road (US 52). ~~During the peak period under the Proposed Action, the queue length along Briggs Street would be approximately 950 feet, which would block one major street, Manhattan Road (US 52).~~According to the City of Joliet, Will County, and IDOT plans, no local roadway improvements are planned for Woodruff Road, Washington Street, or Briggs Street; however, Charlesworth Avenue and US 30, approximately 2,100 feet north of Washington Street, provide grade-separated crossings near Woodruff Avenue and Washington Street, respectively. Will County also identifies upgrading the separate-grade crossing of I-80 from four lanes to six lanes south of the city. This project may occur later than 2015; however, it helps alleviate the congestion within the city core. Cherry Hill Road and Gougar Road parallel Briggs Street to the east and may provide alternative routes for the congested Briggs Street. The Metra RI commuter rail line has an at-grade crossing with the EJ&E rail line within the community. With the key streets operating above capacity and experiencing long queues, the overall level of mobility for the Joliet community would not be good. However, the availability of alternative routes may provide much-needed relief by removing traffic from the congested roadways.

Joliet - Proposed Action

The mobility effects of the Proposed Action would be minimal on South Rowell Avenue and Mills Road. Under the Proposed Action, Briggs Street is the only roadway that has queue lengths that would block a major roadway. During the peak period under the Proposed Action, the queue length along Briggs Street would be approximately 950 feet, compared to 655 feet under the No-Action Alternative. Both the Proposed Action and No-Action alternatives would block one major street, Manhattan Road (US 52). The mobility effects of the Proposed Action would be moderate on Briggs Street.

The Crossing LOS under the Proposed Action conditions for both Woodruff Road and Washington Street is a Crossing LOS E-F, compared to Crossing LOS A-B under the No-Action Alternative. Low speeds of the freight trains entering and leaving the train yard in the vicinity of these roadways create this low LOS. This reflects a significant impact to Woodruff Road and Washington Street due to the Proposed Action.

New Lenox - No-Action

New Lenox has five roadways that cross the EJ&E rail line at-grade. Gougar Road, Nelson Road, Cedar Road, Spencer Road and Schoolhouse Road are two-lane collectors that run north/south crossing the EJ&E rail line south of the village center.

Spencer Road would operate at LOS A-B while Gougar Road, Nelson Road and Schoolhouse Road would operate at LOS C-D. Cedar Road operates at LOS E-F. Gougar Road parallels Cedar Road approximately 2 miles to the west, Nelson Road parallels Cedar approximately 1 mile to the west, and Spencer Road, a two-lane collector, parallels Cedar approximately 1.25 miles to the east. These roadways may provide the available capacity to be a viable alternative route for the congested Cedar Road.

During the peak periods under the No-Action Alternative, no major intersecting roadways would be blocked by the queued vehicles at the crossings.

According to Will County and IDOT plans, no local roadway improvements are planned for Nelson Road, Cedar Road, or Schoolhouse Road. However, the Will County 2020 Transportation Framework Plan recommends Gougar Road be widened from a two-lane undivided collector to a four-lane divided arterial that runs north/south crossing the EJ&E rail line south of the village center. Gougar Road would operate at LOS A-B with the improvements. The improvement may have a positive effect on the operations of Cedar Road. In addition, other roadways parallel to Cedar Road may alleviate congestion on this roadway. Only one roadway would operate at over capacity and none of the roadways experience excessive queuing. Therefore, with the availability of alternate routes for Cedar Road, the overall level of mobility for the New Lenox community would be acceptable.

New Lenox - Proposed Action

During the peak periods under the Proposed Action, no major intersecting roadways would be blocked by queued vehicles at the crossings. The overall mobility effects of the Proposed Action would be minimal.

Frankfort - No-Action

Frankfort has five roadways that cross the EJ&E rail line at-grade and one that has a grade-separated crossing. Harlem Avenue, Pfeiffer Road/88th Avenue, Center Road, and Wolf Road are two-lane arterials that run north/south crossing the EJ&E rail line. Sauk Trail, a two-lane arterial, runs east/west crossing the EJ&E rail line.

Sauk Trail and Center Road would operate at LOS A-B while Harlem Avenue, Pfeiffer Road/88th Avenue~~, Center Road,~~ and Wolf Road would operate at LOS C-D.

During the peak period under the No-Action Alternative, Pfeiffer Road/88th Avenue is the only roadway that has queue lengths that would block a major roadway. In addition, Pfeiffer Road/ 88th Avenue would experience a calculated vehicle queue length of approximately 360 feet, which would block one major roadway, Sauk Trail.

According to the Village of Frankfort 2007 Transportation Master Plan, Pfeiffer Road/88th Avenue and Sauk Trail widen from two lanes to three lanes, including a center turn lane. These upgrades, along with other roadway network improvements, may occur later than 2015; however, they may help

to reduce queuing along Pfeiffer Road/88th Avenue at the EJ&E crossing. In addition, the grade-separated crossing, as well as the at-grade crossings operating at LOS D or better in the area, reflect a roadway network that would be serving the local community well by providing an acceptable level of overall mobility.

- Center Road roadway LOS changes from LOS C-D to LOS A-B.

Frankfort - Proposed Action

During the peak period under the Proposed Action, Pfeiffer Road/88th Avenue is the only roadway that has queue lengths that would block a major roadway. During the peak period under the Proposed Action, Pfeiffer Road/88th Avenue would experience a calculated vehicle queue length of approximately 510 feet, compared with 360 feet under the No-Action Alternative. Both the Proposed Action and No-Action alternatives would block one major roadway, Sauk Trail.

The overall mobility effects of the Proposed Action would be minimal, with the exception of Pfeiffer Road/88th Avenue. Proposed Action and No-Action queue lengths on Pfeiffer Road/88th Avenue block one major roadway. Pfeiffer Road/88th Avenue would experience moderate effects due to the Proposed Action.

Table E1.2-22 summarizes the results of the Will County, Illinois analysis.

TABLE E1.2-22. HIGHWAY/RAIL AT-GRADE CROSSING VEHICLE DELAY FOR NO-ACTION AND PROPOSED ACTION CONDITIONS (YEAR 2015)

COUNTY	STREET	2015 ADT	ROADWAY LOS	QUEUE LENGTH	
				NO-ACTION	PROPOSED ACTION

Will	Harlem Avenue	12,336	D	267	363

Southeastern Cook County, Illinois

Matteson - No-Action

Matteson has three roadways that cross the EJ&E rail line at-grade and three that have grade-separated crossings. Cicero Avenue/IL 50 is a four-lane divided arterial that runs north/south crossing the EJ&E rail line and connects two arterials, Sauk Trail and 211th Street/US 30. Ridgeland Avenue and Main Street are two-lane collectors that run north/south crossing the EJ&E rail line.

Ridgeland Avenue and Main Street operate at LOS A-B while Cicero Avenue/IL 50 would operate at LOS ~~E-F~~ C-D. ~~I-57 parallels Cicero Avenue/IL 50 by approximately 0.5 mile west and can provide the available capacity to be a viable separate grade alternative route for the congested Cicero Avenue/IL 50.~~ During the peak periods under the No-Action Alternative, no major intersecting roadways would be blocked by the queued vehicles at the crossings.

According to Cook County and IDOT plans, no local roadway improvements are planned within the village core. The multiple grade-separated crossings throughout the area reflect a roadway network that would be serving the local community to provide acceptable level of overall mobility.

- Cicero Avenue/IL 50 roadway LOS changes from LOS E-F to LOS C-D.

Matteson - Proposed Action

During the peak periods under the Proposed Action, no major intersecting roadways would be blocked by queued vehicles at the crossings. The overall mobility effects of the Proposed Action would be minimal.

Park Forest - No-Action

Park Forest has one roadway that crosses the EJ&E rail line at-grade. Western Avenue, a five-lane arterial, runs north/south crossing the EJ&E rail line.

Western Avenue would operate at LOS C-D; at the peak periods under the No-Action Alternative, no major intersecting roadways would be blocked by the queued vehicles at the crossing. With Western Avenue operating at LOS C-D, the overall level of mobility for the Park Forest community would be acceptable.

Park Forest - Proposed Action

During the peak periods under the Proposed Action, no major intersecting roadways would be blocked by queued vehicles at the crossing. The overall mobility effects of the Proposed Action would be minimal.

Chicago Heights - No-Action

Chicago Heights has six roadways that cross the EJ&E rail line at-grade and one grade-separated crossing. Chicago Road/IL 1, a four-lane divided arterial that runs north/south crossing the EJ&E rail line, connects two arterials, 26th Street and 14th Street/US 30. Halsted Street and East End Avenue are two-lane collectors that run north/south crossing the EJ&E rail line south of the city center. State Street and Cottage Grove Avenue are four-lane divided arterials that run north/south crossing the EJ&E rail line east of the city center. Wentworth Avenue, a two-lane collector, runs north/south crossing the EJ&E rail line east of the city center.

East End Avenue, State Street, Cottage Grove Avenue, and Wentworth Avenue would operate at LOS A-B while Halsted Street and Chicago Road/IL 1 would operate at LOS C-D.~~Chicago Road/IL 1 would operate at LOS E-F. State Street parallels Chicago Road/IL 1 approximately 1.25 miles east and may provide the available capacity to be a viable alternative route for the congested Chicago Road/IL 1.~~The proposed Metra southeast commuter rail line has an at-grade crossing with the Elsdon Subdivision within the community.

During peak periods under the No-Action Alternative, no major intersecting roadways would be blocked by queued vehicles at the crossings.

According to Cook County and IDOT plans, there are planned improvements within the village core. The Cook County Highway Transportation Plan identifies plans for railroad crossing safety improvements at a railroad crossing along State Street south of Joe Orr Road. This improvement may have a positive effect on the operations of the roadway network within the village core. There are plans to widen the roadway, upgrade the railroad crossing, and improve traffic signal and illumination for Western Avenue between Illinois Street and Steger Road. ~~With the exception of Chicago Road/IL 1, t~~The grade-separated crossing, as well as the multiple at-grade crossings operate at LOS D or better through the area, reflecting a roadway network that is serving the local community well by providing an acceptable level of overall mobility.

- Chicago Road/IL 1 roadway LOS changes from LOS E-F to LOS C-D.

Chicago Heights - Proposed Action

During the peak periods under the Proposed Action, no major intersecting roadways would be blocked by queued vehicles at the crossings. The overall mobility effects of the Proposed Action would be minimal.

Sauk Village - No-Action

Sauk Village has one roadway that crosses the EJ&E rail line at-grade and one that has a grade-separated crossing. Torrence Avenue, a two-lane undivided arterial, runs north/south crossing the EJ&E rail line.

Torrence Avenue would operate at LOS C-D and at peak periods under the No-Action Alternative, no major intersecting roadways would be blocked by queued vehicles at the crossing.

Sauk Village - Proposed Action

During the peak periods under the Proposed Action, no major intersecting roadways would be blocked by queued vehicles at the crossing. The overall mobility effects of the Proposed Action would be minimal.

Lynwood - No-Action

Lynwood has one roadway that crosses the EJ&E rail line at-grade. Lincoln Highway/US 30, a four-lane divided arterial, runs north/south crossing the EJ&E rail line and connects two arterials, Sauk Trail and Glenwood Dyer Road.

During the peak period under the No-Action Alternative, no major intersecting roadways would be blocked by queued vehicles at the crossing.

According to Cook County and IDOT plans, no local roadway improvements are planned for Lincoln Highway/US 30 in the vicinity of the crossing. With no alternative routes and Lincoln Highway/ US 30 operating over capacity, the overall level of mobility for the Lynwood community would be unacceptable.

Lynwood - Proposed Action

During the peak period under the Proposed Action, Lincoln Highway/US 30 would experience a calculated vehicle queue length of approximately ~~1,275~~ 940 feet, compared with ~~860~~635 feet during the No-Action Alternative. The Proposed Action queuing would block one major roadway, Sauk Trail, which is not blocked under the No-Action Alternative. The blockage of Sauk Trail under the Proposed Action is a significant impact to Lincoln Highway/US 30.

- Lincoln Highway/US 30 No Action queue length changes from 1,275 feet to 940 feet. Lincoln Highway/US 30 Proposed Action queue length changes from 860 feet to 635 feet. The Proposed Action queuing would block one major roadway, Sauk Trail, which is not blocked under the No-Action Alternative. The blockage of Sauk Trail under the Proposed Action is a significant impact to Lincoln Highway/US 30.

Table E1.2-23 summarizes the results of the Southeastern Cook County, Illinois analysis.

Table E1.2-23. Highway/Rail At-Grade Crossing Vehicle Delay for No-Action and Proposed Action Conditions (Year 2015)

County	Street	2015 ADT	Roadway LOS	Queue Length	
				NO-ACTION	PROPOSED ACTION
Cook	Ridgeland Avenue	3,642	B	158	214
Cook	Cicero Avenue/IL 50	23,281	D	504	777
Cook	Main Street	4,375	B	173	262
Cook	Western Avenue	24,717	D	528	863
Cook	Chicago Road/IL 1	23,390	D	718	1,091
Cook	West End Avenue/South Halsted Street	5,956	C	396	604
Cook	East End Avenue	5,086	B	325	515
Cook	Wentworth Avenue	4,563	B	292	467
Cook	State Street	7,656	A	418	690
Cook	Cottage Grove Avenue	5,578	A	121	179
Cook	Torrence Avenue	8,968	C	337	486
Cook	Lincoln Highway/US 30	29,237	E	634	939

Lake County, Indiana

Dyer - No-Action

Dyer has two roadways that cross the EJ&E rail line at-grade and one that has a grade-separated crossing. Hart Street is a two-lane undivided arterial that runs north/south crossing the EJ&E rail line and connects two arterials, Sauk Trail and Matteson Street. Lake Street, a two-lane collector, runs north/south crossing the EJ&E rail line west of the village center. Hart Street, a two-lane undivided arterial, runs north/south crossing the EJ&E rail line west of the village center. Hart Street becomes Matteson Street north of the EJ&E rail line.

Lake Street would operate at LOS A-B. Hart Street would operate at LOS E-F and no improvements are planned for this roadway. Lake Street parallels Hart Street approximately 700 feet to the west; therefore, Lake Street can provide the available capacity to be a viable alternative route for the congested Hart Street.

During the peak periods under the No-Action Alternative, ~~no major intersecting roadways would be blocked by queued vehicles at the crossings.~~ Hart Street would experience a calculated queue length of approximately 860 feet, which will block one major roadway, Matteson Street.

According to Lake (IN) County and INDOT plans, no local roadway improvements are planned for Hart Street. The close proximity of other alternative crossing routes and available capacity at these crossing locations allow for good overall mobility in the Dyer area.

Dyer - Proposed Action

During the peak periods under the Proposed Action, no major intersecting roadways would be blocked by queued vehicles at the Lake Street crossing~~s. The overall mobility effects of the Proposed~~

~~Action would be minimal.~~Therefore, Lake Street would experience minimal effects due to the Proposed Action

During the peak period under the Proposed Action, Hart Street would experience a calculated vehicle queue length of approximately 1,275 feet, compared to 860 feet for the No-Action Alternative. Both the No-Action and Proposed Action queuing of Hart Street would block one major roadway, Matteson Street. Therefore, Hart Street would experience moderate effects due to the Proposed Action.

Schererville - No-Action

Schererville has two roadways that cross the EJ&E rail line at-grade and one that has a grade-separated crossing. Kennedy Avenue is a two-lane undivided arterial that runs north/south crossing the EJ&E rail line and connects two arterials, Main Street and Joliet Street. Airport Road is a two-lane undivided collector that runs north/south crossing the EJ&E rail line.

Kennedy Avenue would operate at LOS E-F. Indianapolis Boulevard, which runs parallel to Kennedy Avenue approximately 0.5 mile west, is a five-lane divided arterial that provides an alternative access route with a grade separated crossing. Airport Road would operate at LOS A-B.

During peak periods under the No-Action Alternative, no major intersecting roadways would be blocked by queued vehicles at the crossings.

According to Lake (IN) County and INDOT plans, no local roadway improvements are planned within the village core. The close proximity of a grade-separated alternative route would allow for good overall mobility in the Schererville area.

Schererville - Proposed Action

During the peak periods under the Proposed Action, no major intersecting roadways would be blocked by queued vehicles at the crossings. The overall mobility effects of the Proposed Action would be minimal.

Griffith - No-Action

Griffith has seven roadways that cross the EJ&E rail line at-grade in close proximity to each other and one grade-separated crossing. Broad Street, a two-lane undivided arterial, runs north/south crossing the EJ&E rail line. Main Street, a two-lane collector, runs east/west. 45th Avenue, a four-lane collector, runs east/west. 40th Place, a two-lane collector, runs east/west. Lake Street, Miller Street, and Elm Street are two-lane collectors that run east/west.

Main Street, Broad Street, 45th Avenue, and 40th Place would operate at LOS E-F and Lake Street, Miller Street, and Elm Street would operate at LOS D or better. Broad Street does not have any good alternative route. Kennedy Avenue runs west of Broad Street and would operate at LOS E-F and Colfax Street runs east of Broad Street and the LOS data is not available during the time of this study. Lake Street is approximately 1,320 feet north of Main Street and would provide the additional capacity needed to be a viable alternative route to the congested Main Street. Elm Street is approximately 2,640 feet south of Main Street would provide the additional capacity needed to be a viable alternative route to the congested 45th Avenue. Ridge Road is a grade-separated crossing approximately 1,690 feet north of 40th Place and would provide the additional capacity needed to be a viable alternative route to the congested 40th Place.

During the peak periods under the No-Action Alternative, Broad Street is the only roadway that has queue lengths that would block a major roadway. At the peak period under the No-Action Alternative, Broad Street would experience a calculated vehicle queue length of approximately ~~905~~1,315 feet, which would block one major roadway, Main Street.

According to Lake (IN) County and INDOT plans, no local roadway improvements are planned within the village core. With Broad Street operating over capacity with no alternative routes, the overall mobility in the Griffith area would not be acceptable.

Griffith - Proposed Action

During the peak periods under the Proposed Action, Broad Street is the only roadway that has queue lengths that would block a major roadway. At peak periods under the Proposed Action, Broad Street would experience a calculated vehicle queue length of approximately ~~1,615~~ 1,920 feet, compared with ~~905~~1,315 feet under the No-Action Alternative. Under both the Proposed Action and No-Action alternatives, Broad Street would block one major roadway, Main Street.

The overall mobility effects of the Proposed Action would be minimal, with the exception of Broad Street, which would experience moderate effects due to the Proposed Action.

- Broad Street No Action queue length changes from 905 feet to 1,315 feet. Broad Street Proposed Action queue length changes from 1,615 feet to ~~920~~ 1,920 feet. Both the No-Action and Proposed Action queuing of Broad Street would block one major roadway, Main Street. Therefore, Main Street would experience moderate effects due to the Proposed Action.

Gary - No-Action

Gary has four roadways that cross the EJ&E rail line at-grade in close proximity to each other and seven grade-separated crossings. 25th Avenue, a two-lane collector, runs east/west. 15th Avenue is a two-lane undivided arterial that runs east/west crossing the EJ&E rail line. Ninth Avenue, a two-lane collector, runs east/west crossing the EJ&E rail line. Fifth Avenue, a four-lane arterial, runs east/west crossing the EJ&E rail line.

Ninth Avenue and 25th Avenue would operate at LOS A-B, Fifth Avenue would operate at LOS C-D, and 15th Avenue would operate at LOS E-F. Fifth Avenue is approximately 1 mile north of 15th Avenue and 25th Avenue is approximately 1 mile south of 15th Avenue; both of these roadways would provide the additional capacity needed to be a viable alternative route to the congested 15th Avenue.

During the peak periods under the No-Action Alternative, no major intersecting roadways would be blocked by queued vehicles at the crossings.

According to Lake (IN) County and INDOT plans, no local roadway improvements are planned within the city core. Close proximity of alternative crossing routes and available capacity at existing crossing locations allow for good overall mobility in the Gary area.

Gary - Proposed Action

During the peak periods under the Proposed Action, no major intersecting roadways would be blocked by queued vehicles at the crossings. The overall mobility effects of the Proposed Action would be minimal.

Table E1.2-24 summarizes the results of the Lake County, Indiana analysis.

Table E1.2-24. Highway/Rail At-Grade Crossing Vehicle Delay for No-Action and Proposed Action Conditions (Year 2015)					
County	Street	2015 ADT	Roadway LOS	Queue Length	
				NO-ACTION	PROPOSED ACTION
Lake (IN)	Lake Street	5,067	B	220	318
Lake (IN)	Hart Street	20,268	F	859	1,272
Lake (IN)	Airport Road	3,818	B	146	215
Lake (IN)	Kennedy Avenue	17,076	F	665	981
Lake (IN)	Broad Street	19,572	F	~~901~~ 1,311	1,916

Lake (IN)	9 th Avenue	4,187	B	159	233
Lake (IN)	5th Avenue	28,467	D	537	807

CN Subdivision Evaluation

The second step in assessing the effects of the Proposed Action on 2015 roadway conditions was to summarize highway/rail at-grade crossings along CN subdivisions that meet the Board's analysis thresholds, and to identify the communities in which those crossings are located. The LOS and vehicle queue length results for each subdivision at-grade crossing location are contained in Table E1.2-11 and Tables E1.2-13 through E1.2-17, respectively. Roadways with an LOS E or LOS F were designated as critical. Based on the LOS and queue length results, SEA evaluated the 2015 roadway network and overall mobility in the vicinity of each of the critical roadways. The narrative below discusses the 2015 conditions of the roadway network in the vicinity of the highway/rail at-grade crossings within each community, which include the network connectivity and vehicle queue lengths associated with critical crossings. The vehicle queue lengths were calculated for the existing conditions and the Proposed Action. The narratives identify only the vehicle queue lengths that may block a major roadway, in turn affecting the community's level of overall mobility.

The evaluation summary has been divided into sections that summarize each community located along each of the CN subdivisions. Table E1.2-25 summarizes the resulting 2015 roadway LOS for locations along the CN subdivisions. Tables E1.2-13 through E1.2-17 present the resulting 2015 LOS for highway/rail at-grade crossings that meet the evaluation.

The new analysis resulted in several changes in LOS for the CN rail line. Below is a summary of those changes for the 2015 roadway LOS analysis

Table E1.2-25. 2015 Level of Service Summary of Roadways Crossing the CN Subdivisions												
LOS	Total		Waukesha		Freeport		Joliet		Chicago		Elsdon	
	2007	2015	2007	2015	2007	2015	2007	2015	2007	2015	2007	2015
LOS A - B	74	63	20	18	17	4	9	8	1	1	27	22
LOS C - D	49	44	17	16	13	10	2	3	0	0	17	15
LOS E - F	29	45	10	13	6	12	3	3	1	1	9	16

Waukesha Subdivision

The Proposed Action would not affect the overall mobility in the following three communities along CN's Waukesha Subdivision because all of the crossings in these communities are grade-separated:

- Forest Park (4 grade-separated crossings)
- Schiller Park (4 grade-separated crossing)
- Rosemont (3 grade-separated crossings)

River Forest

River Forest has four roadways that cross the Waukesha Subdivision at-grade and two grade-separated crossings. All of the at-grade crossings would operate at LOS C or better.

During the peak period under the No-Action and Proposed Action alternatives, no major intersecting roadways would be blocked by queued vehicles at the crossings. The multiple grade-separated crossings, as well as the at-grade crossings operating at LOS C or better in the area, provide an acceptable level of overall mobility.

River Grove

River Grove has two roadways that cross the Waukesha Subdivision at-grade and one grade-separated crossing. First Avenue is a six-lane arterial that runs north/south crossing the Waukesha Subdivision south of the village center. All of the at-grade crossings would operate at LOS C or better.

During the peak period under the No-Action Alternative, 1st Avenue would experience a calculated vehicle queue of approximately ~~1,130~~ 1,280 feet. This peak hour queue would block North Avenue (IL 64), a major cross street north of the crossing.

During the peak period under the Proposed Action, the calculated peak hour queue length along 1st Avenue would be approximately ~~200~~0 feet. This would not block any major roadways.

Excessive peak hour queuing at 1st Avenue would have an affect on overall mobility within the area. Under the Proposed Action, train reductions would improve the overall mobility by reducing the queues at this crossing.

Melrose Park

Melrose Park has one roadway that crosses the Waukesha Subdivision at-grade, which would operate at LOS B.

During the peak period under the No-Action and Proposed Action alternatives, no major intersecting roadways would be blocked by queued vehicles at the crossing. The crossing would operate at LOS B or better, providing an acceptable level of overall mobility.

Franklin Park

Franklin Park has three roadways that cross the Waukesha Subdivision at-grade and one grade-separated crossing. All of the at-grade crossings would operate at LOS B or better. The Metra MD-W commuter rail line has an at-grade crossing with the Waukesha Subdivision within the community.

During the peak periods under the No-Action and Proposed Action alternatives, no major intersecting roadways would be blocked by queued vehicles at the crossings. The multiple grade-separated crossings, as well as the at-grade crossings, would operate at LOS B or better, providing an acceptable level of overall mobility.

Des Plaines

Des Plaines has ~~15~~ 14 roadways that cross the Waukesha Subdivision at-grade and two that have grade-separated crossings. Three at-grade crossing roadways would continue to operate at LOS E-F. The Metra UP-NW commuter rail line has an at-grade crossing with the Waukesha Subdivision within the community. The roadways are subdivided into three networks, including roadways south of the city center, roadways within the city center, and roadways north of the city center.

South of the city center:

- Pratt Avenue is a two-lane collector that runs east/west and intersects US 12.
- Touhy Avenue is a four-lane divided arterial that runs east/west and intersects Lee Street and US 12.
- The US 12 Frontage Road is a two-lane collector that runs north/south and intersects US 12 and Touhy Avenue.
- Prospect Avenue is a two-lane collector that runs east/west and intersects Lee Street and US 12.
- Oakton Street is a four-lane arterial that runs east/west and intersects Lee Street (US 12). All of the above mentioned roadways would operate at LOS D or better.

Within the city center:

- Algonquin Road is a two-lane arterial that runs east/west and intersects Lee Street (US 12).
- Lee Street (NB US 12) is a two-lane, one-way arterial that runs northbound and intersects Touhy Avenue, Prospect Avenue, US 12, Oakton Street, Algonquin Road, Graceland Avenue (SB US 12), Thacker Street, Prairie Avenue, and Rand Road.
- Graceland Avenue (SB US 12) is a two-lane, one-way arterial that runs southbound and intersects Lee Street (NB US 12), Thacker Street, Prairie Avenue, and Rand Road (US 12).
- Thacker Street is a two-lane collector that runs east/west and intersects Graceland Avenue (SB US 12) and Lee Street (NB US 12).
- Prairie Avenue is a two-lane collector that runs east/west and intersects Graceland Avenue (SB US 12) and Lee Street (NB US 12).

~~Woodlawn Avenue is a two-lane collector that runs east/west~~Graceland Avenue (SB US 12) and Thacker Street would operate at LOS E-F, while Algonquin Road, Lee Street (US 12 NB) and Prairie Avenue ~~and Woodlawn Avenue~~ would operate at LOS D or better. Prairie Avenue crosses the Waukesha Subdivision approximately 1,600 feet to the north of Graceland Avenue (SB US 12), and Algonquin Road crosses the Waukesha Subdivision approximately 1,800 feet south of Graceland Avenue (SB US 12). Both roadways would provide potential alternative routes to the congested Graceland Avenue (SB US 12). Prairie Avenue crosses the Waukesha Subdivision parallel to

Thacker Street approximately 800 feet to the north, and Algonquin Road crosses the Waukesha Subdivision parallel to Thacker Street approximately 2,700 feet to the south. Both roadways would provide potential alternative routes to the congested Thacker Street.

West of the city center:

- Seegers Road is a two-lane collector that runs east/west and intersects Rand Road (US 12).
- Golf Road (IL 58) is a four-lane divided arterial that runs east/west and intersects Rand Road (US 12).
- Rand Road (US 12) is a four-lane divided arterial that runs north/south and intersects Lee Street, Seegers Road, Golf Road (IL 58), and Central Road.
- Central Road is a two-lane arterial that runs east/west and intersects Rand Road (US 12).

Golf Road (IL 58) and Central Road would operate at LOS E-F, while Seegers Road and Rand Road (US 12) would operate at LOS D or better. Rand Road (US 12) crosses the Waukesha Subdivision approximately 3,900 feet to the south of Central Road and approximately 525 feet to the north of Golf Road (IL 58). This roadway provides potential alternative routes to the congested Central Road and the congested Golf Road (IL 58).

During the peak period under ~~both~~the No-Action ~~and Proposed Action alternatives~~ alternative, Touhy Avenue (IL 72), Prospect Avenue ~~Lane~~, Oakton Street, and Algonquin Road would experience a calculated vehicle queue length of approximately 855 feet, ~~190~~ 375 feet, 1,110 feet and 800 feet, respectively. The peak-hour queues would block US 12, a major cross street west of each crossing. The peak-hour queue length along Thacker Street would be approximately 990 feet. This would block Graceland Avenue (SB US 12), a major cross street east of the crossing The queue length along Golf Road (IL 58) would be approximately ~~1,370~~ 1,325 feet. This would block Rand Road (US 12), a major cross street east of the crossing. The queue length along Rand Road (US 12) would be approximately ~~1,115~~ 1,080 feet. This would block Golf Road (IL 58), a major cross street south of the crossing.

During the peak period under the Proposed Action, Touhy Avenue (IL 72), Prospect ~~Lane~~ Avenue, and Algonquin Road would experience queue lengths of approximately ~~440~~ 435 feet, ~~100~~ 190 feet, and 440 feet, respectively. The queues would block US 12, a major cross street west of each crossing. The calculated peak hour queue along Golf Road (IL 58) would be approximately ~~760~~ 735 feet. This would block Rand Road (US 12), a major cross street east of the crossing. One local street would be blocked in addition to Rand Road (US 12).

According to the City of Des Plaines, Cook County, and IDOT, no local roadway improvements are planned within the city core that would have a direct benefit to existing at-grade crossings.

Excessive peak hour queues at multiple at-grade crossings would have a significant affect on overall mobility within the area. Although reduction of railway operations helps alleviate some of these issues, excessive peak hour queues would still exist under the Proposed Action.

- Based on the updated analysis, Woodlawn Avenue is not included in the list of roadways for Des Plaines since it does not meet the SEA criteria of a projected 2015 ADT of greater than 2,500 vpd. Therefore, Des Plaines has changed from having 15 roadways to 14 roadways that cross the Waukesha Subdivision at-grade, as part of the analysis.

Mount Prospect

Mount Prospect has two roadways that cross the Waukesha Subdivision at-grade, both operating at LOS D or better.

During the peak period under the No-Action Alternative, Euclid Avenue would experience a calculated peak hour vehicle queue of approximately ~~675~~ 680 feet. This would block Wolf Road, a major cross street west of the crossing.

During the peak period under the Proposed Action, the queue length along Euclid Avenue would be approximately 370 feet. This would not block any major roadways.

Excessive peak hour queuing at Euclid Avenue would have an affect on overall mobility within the area. Train reductions under the proposed Action would improve the overall mobility by reducing the queues at this crossing.

Prospect Heights

Prospect Heights has three roadways that cross the Waukesha Subdivision at-grade and one grade-separated crossing. Wolf Road is a two-lane arterial that runs north/south crossing the Waukesha Subdivision east of the city center and intersects Camp McDonald Road and Willow Road. Camp McDonald Road is a two-lane collector that runs east/west crossing the Waukesha Subdivision east of the city center and intersects Wolf Road. Willow Road is a two-lane collector that runs east/west crossing the Waukesha Subdivision east of the city center and intersects Wolf Road. Wolf Road would operate at LOS E-F, while Camp McDonald Road and Willow Road would operate at LOS D or better. Camp McDonald Road crosses the Waukesha Subdivision approximately 375 feet to the north of Wolf Road and provides a potential alternative route to the congested Wolf Road.

During the peak period, under the No-Action Alternative, Camp McDonald Road would experience a calculated vehicle queue of approximately 610 feet. This would block Wolf Road, a major cross street east of the crossing.

During the peak period, under the Proposed Action, Camp McDonald Road would experience a calculated vehicle queue length of approximately 335 feet. This would block Wolf Road, a major cross street east of the crossing.

According to Cook County and IDOT, local roadway improvements are planned within the city core: The IDOT plan calls for construction of additional lanes on Wolf Road between Hintz Road and Palatine Road by 2013. This project would help alleviate congestion within the city core; however, it would not improve level of service along Wolf Road in the vicinity of the Waukesha Subdivision at-grade rail crossing.

Excessive peak hour queuing at Camp McDonald Road would have a significant effect on overall mobility within the area. Although reduction of railway operations helps alleviate this issue, excessive peak hour queues would still exist under the Proposed Action.

Wheeling

Wheeling has two roadways that cross the Waukesha Subdivision at-grade and two grade-separated crossings. Hintz Road is a four-lane divided collector that runs east/west crossing the Waukesha Subdivision south of the village center. Dundee Road (IL 68) is a four-lane divided arterial that runs east/west crossing the Waukesha Subdivision north of the village center. Hintz Road and Dundee Road (IL 68) would operate at LOS E-F. Lake Cook Road provides a grade-separated crossing of the Waukesha Subdivision parallel to Dundee Road (IL 68) approximately 1 mile to the north, and would provide a potential alternative route to the congested Dundee Road (IL 68). Palatine Road provides a grade-separated crossing of the Waukesha Subdivision parallel to Hintz Road approximately 1 mile to the south, and would provide a potential alternative route to the congested Hintz Road.

During the peak period under both the No-Action and Proposed Action alternatives, no major intersecting roadways would be blocked by queued vehicles at the crossings.

According to the Village of Wheeling, Cook County, and IDOT, two local roadway improvements are planned within the Village core that would have a direct impact on mobility within the area: Wheeling proposes construction of one grade-separated crossing on Waukesha Subdivision south of Dundee Road, and construction of an additional at-grade crossing to align with Carpenter Avenue. Both of these crossings would help alleviate the congestion within the village core. The existence of the viable alternative routes to congested roadways within the area would provide an acceptable level of overall mobility within the Wheeling area.

Buffalo Grove

Buffalo Grove has one roadway that crosses the Waukesha Subdivision at-grade, operating at LOS ~~D~~ E-F.

During the peak period under the No-Action Alternative, Deerfield Parkway/Busch Drive would experience a calculated vehicle queue length of approximately ~~1,350~~ 1,510 feet. This would block Busch Road, a major cross street east of the crossing.

During the peak period under the Proposed Action, Deerfield Parkway/Busch Drive would experience a calculated vehicle queue length of approximately ~~750~~ 835 feet. This would still block Busch Road.

During the peak period under both the No-Action and Proposed Action alternatives, one major intersecting roadway (Busch Road) would be blocked by the queued vehicles at the Deerfield Parkway/Busch Road crossing. With the at-grade crossing operating at LOS E-F, ~~an acceptable level of~~ of the level of overall mobility ~~exists.~~ would be affected for the Buffalo Grove area.

Prairie View

Prairie View has three roadways that cross the Waukesha Subdivision at-grade. Aptakisic Road is a four-lane divided arterial that runs east/west crossing the Waukesha Subdivision south of the village center and intersects Buffalo Grove Road. Half Day Road (IL 22) is a four-lane arterial that runs east/west crossing the Waukesha Subdivision within the village center and intersects Buffalo Grove Road. Buffalo Grove Road is a two-lane divided collector that runs north/south crossing the Waukesha Subdivision within the Village center and intersects Aptakisic Road and Half Day Road (IL 22). Buffalo Grove Road would operate at LOS E-F, while Aptakisic Road and Half Day Road (IL 22) would operate at LOS D or better. Half Day Road (IL 22) crosses the Waukesha Subdivision approximately 3,400 feet to the south of Buffalo Grove Road, and would provide a potential alternative route to the congested Buffalo Grove Road.

During the peak period under the No-Action Alternative, Aptakisic Road would experience a calculated vehicle queue length of approximately ~~980~~ 945 feet. This would block Weiland Road, a major cross street west of the crossing. The calculated peak hour queue along Half Day Road (IL 22) would be approximately ~~1,475~~ 1,390 feet. This would block Prairie Road, a major cross street east of the crossing.

During the peak period under the Proposed Action, Aptakisic Road would experience a calculated vehicle queue length of approximately ~~540~~ 525 feet. This would still block Weiland Road. The calculated peak hour queue length along Half Day Road (IL 22) would be approximately ~~840~~ 795 feet. This would still block Prairie Road.

According to Lake County and IDOT, several local roadway improvements are planned within the village core. The Lake County plan calls for upgrading traffic signal interconnect equipment and replacing existing controllers at signalized intersections between Parkway Drive and Buffalo Grove Road by 2012. It also calls for widening Buffalo Grove Road at Port Clinton Road and the Wisconsin Central Railroad at-grade crossing, improving mobility in the community.

Excessive peak hour queueing at multiple at-grade crossings within the Prairie View community would have a significant affect on overall mobility within the area. Although reduction of railway operations helps alleviate these issues, excessive peak hour queues would still exist under the Proposed Action.

Vernon Hills

Vernon Hills has two roadways that cross the Waukesha Subdivision at-grade. US 45 is a two-lane arterial that runs east/west crossing the Waukesha Subdivision south of the village center and intersects Butterfield Road. Butterfield Road is a four-lane divided arterial that runs north/south crossing the Waukesha Subdivision west of the village center and intersects US 45. US 45 would operate at LOS E-F, while Butterfield Road would operate at LOS D or better. No potential alternative routes exist within one mile of the US 45 at-grade crossing.

During the peak period under the No-Action Alternative, Butterfield Road would experience a calculated vehicle queue length of approximately ~~600~~ 550 feet. This would block Townline Road (IL 60), a major cross street west of the crossing

During the peak period under the Proposed Action, the queue lengths along Butterfield Road would be approximately ~~345~~325 feet. This would not block any major roadways

According to the Village of Vernon Hills, Lake County, and IDOT, the following roadway improvements are planned within the village core: Vernon Hills proposes to widen US 45 from two to four lanes from Milwaukee Avenue to IL 83 with additional turning lanes at area intersections, and to widen Townline Road (IL 60) to a six-lane section between US 41 and IL 83. With the upgrade of US 45 to a four-lane arterial, this roadway would achieve an LOS C, which would improve the level of overall mobility in the area.

Mundelein

Mundelein community has ~~seven~~ six roadways that cross the Waukesha Subdivision at-grade and three grade-separated crossings. Two at-grade crossing roadways operate at unacceptable levels of service. Townline Road (IL 60) is a four-lane, divided arterial that runs east/west crossing the Waukesha Subdivision south of the village center. Allanson Road is a two-lane collector that runs east/west crossing the Waukesha Subdivision south of the village center. Hawley Street is a two-lane collector that runs east/west crossing the Waukesha Subdivision within the village center and intersects Maple Avenue (IL 176). Park Street is a two-lane collector that runs east/west crossing the Waukesha Subdivision within the village center. Maple Avenue (IL 176) is a two-lane arterial that runs east/west crossing the Waukesha Subdivision within the village center and intersects Hawley Street. ~~Dunbar Road is a two-lane collector that runs east/west crossing the Waukesha Subdivision north of the village center.~~ Winchester Road is a two-lane collector that runs east/west crossing the Waukesha Subdivision north of the village center. Townline Road (IL 60) and Allanson Road would operate at LOS E-F, while Hawley Street, Park Street, Maple Avenue (IL 176~~), Dunbar Road,~~ and Winchester Road would operate at LOS D or better. Butterfield Road crosses the Waukesha Subdivision approximately 650 feet to the south of Townline Road (IL 60), and would provide a potential alternative to the congested Townline Road (IL 60). Courtland Street provides a grade-separated crossing parallel to Allanson Road, approximately 3,400 feet to the north, and would provide a potential alternative route to the congested Allanson Road. The Village of Vernon Hills proposes to widen Townline Road (IL 60) from four to six lanes between US 41 and IL 83. With the upgrade of Townline Road (IL 60) to a six-lane arterial, this roadway would achieve an LOS D.

During the peak period under pre-acquisition conditions, Townline Road (IL 60) would experience a calculated vehicle queue length of approximately ~~1,520~~ 1,265 feet. This would block Butterfield Road, a major cross street east of the crossing. During the peak period, Maple Avenue (IL 176)

would experience a calculated vehicle queue length of approximately ~~980~~ 950 feet. This would block Lake Street (US 45), a major cross street west of the crossing. The calculated peak-hour queue length along Winchester Road would be approximately ~~245~~ 200 feet. This would block Lake Street (US 45).

During the peak period under the Proposed Action, Townline Road (IL 60) would experience a calculated vehicle queue length of approximately ~~840~~755 feet. This would still block Butterfield Road. During the peak period, Maple Avenue (IL 176) would experience a calculated vehicle queue length of approximately ~~540~~1,080 feet. This would still block Lake Street (US 45). ~~In addition, three local streets would block this roadway.~~ The calculated peak hour queue along Winchester Road would be approximately ~~135~~230 feet. This would still block Lake Street (US 45).

According to Lake County and IDOT, the following roadway improvements are planned within the village core: The Lake County plan calls for a railroad underpass feasibility study at the Townline Road (IL 60) crossing of the Wisconsin Central Railroad. This project would improve mobility by eliminating the queues produced at the at-grade crossing and would have a positive affect on the intersection of Butterfield Road and Townline Road (IL 60). As stated above, the Village of Vernon Hills proposes to widen Townline Road (IL 60) to a six-lane section between US 41 and IL 83. With upgrade of Townline Road to a six-lane section, this roadway would achieve LOS D.

Excessive peak hour queues at multiple at-grade crossings within the Mundelein community would have a significant affect on overall mobility within the area. Although reduction of railway operations helps alleviate these issues, excessive peak hour queues would still exist under the Proposed Action. With the key streets operating above capacity, and excessive queues at multiple at-grade crossings, the overall level of mobility for the Mundelein community would not be good. However the improvements proposed by Lake County and IDOT may provide much-needed relief by removing traffic from the congested roadways.

- Based on the updated analysis, Dunbar Road is not included in the list of roadways for Mundelein since it does not meet the SEA criteria of a projected 2015 ADT of greater than 2,500 vpd. Therefore, Mundelein has changed from having seven roadways to six roadways that cross the Waukesha Subdivision at-grade, as part of the analysis.

Grayslake

Grayslake has two roadways that cross the Waukesha Subdivision at-grade. Peterson Road is a two-lane collector that runs east/west crossing the Waukesha Subdivision south of the village center and intersects Harris Road. Harris Road is a two-lane collector that runs north/south crossing the Waukesha Subdivision south of the village center and intersects Peterson Road. Peterson Road would operate at LOS E-F, while Harris Road would operate at LOS D or better. Harris Road crosses the Waukesha Subdivision approximately 3,300 feet north of Peterson Road, and could provide a potential alternative route to the congested Peterson Road. The Metra MD-N commuter rail line has an at-grade crossing with the Waukesha Subdivision within the community.

During the peak periods under the No-Action and Proposed Action alternatives, no major intersecting roadways would be blocked by queued vehicles at the crossings.

According to the Village of Grayslake, Lake County, and IDOT, the following roadway improvements are planned within the village core: The Lake County plan calls for upgrade of Peterson Road to a divided facility with partial access control between IL 83 and US 45 by 2012; however, this improvement would not significantly improve capacity on the roadway at the at-grade crossing of the Waukesha Subdivision. The existence of viable alternative routes to congested roadways within the area would continue to provide an acceptable level of overall mobility to the area.

Freeport Subdivision

The Proposed Action would not affect the overall mobility in the following four communities along CN's Freeport Subdivision because all of the crossings in these communities are grade-separated:

- Cicero (6 grade-separated crossings)
- Westchester (3 grade-separated crossings)
- Berkeley (1 grade-separated crossing)
- Glendale Heights (2 grade-separated crossings)

Chicago

Chicago has ~~two~~ one roadway~~s~~ that cross~~es~~ the Freeport Subdivision at-grade and 24 grade-separated crossings.~~South Lawndale Avenue is a two-lane urban collector that runs north/south crossing the Freeport Subdivision.~~ South Pulaski Road is a four-lane urban arterial that runs north/south crossing the Freeport Subdivision. ~~South Lawndale Avenue and~~ South Pulaski Road operate~~s~~ at LOS D or better and would continue to do so under both the No-Action and Proposed Action alternatives, providing an acceptable level of overall mobility.

During the peak period under both the No-Action and Proposed Action alternatives, no major intersecting roadways would be blocked by queued vehicles at the crossing~~s~~.

According to IDOT, Cook County, and City of Chicago plans, no local roadway improvements are planned which would affect the ~~South Lawndale Avenue and~~ South Pulaski Road crossing~~s~~. The at-grade crossing~~s~~ would operate at LOS C-D in the area, providing an acceptable level of overall mobility.

- Based on the updated analysis, South Lawndale Avenue is not included in the list of roadways for Chicago since it does not meet the SEA criteria of a projected 2015 ADT of greater than 2,500 vpd. Therefore, Chicago has changed from having two roadways to one roadway that crosses the Freeport Subdivision at-grade, as part of the analysis.

Berwyn

Berwyn has one roadway that crosses the Freeport Subdivision at-grade and three grade-separated crossings. Riverside Drive is a two-lane urban collector that runs north/south crossing the Freeport Subdivision. Riverside Drive currently operates at LOS ~~C-D~~ A-B and would continue to do so under the No-Action and Proposed Action alternatives. The Metra BNSF commuter rail line has an at-grade crossing with the Freeport Subdivision within the community.

During the peak period under both the No-Action and Proposed Action alternatives, no major intersecting roadways would be blocked by the queued vehicles at the crossings.

According to the IDOT and Cook County plans, no local roadway improvements are planned which would affect the Riverside Drive crossings. The at-grade crossing would operate at LOS C-D in the area which reflects a roadway network that would serve the local community well by providing an acceptable level of overall mobility.

North Riverside

North Riverside has seven roadways that cross the Freeport Subdivision at-grade. Harlem Avenue (IL 43) is a four-lane divided urban arterial that runs north/south crossing the Freeport Subdivision. 26th Street is a four-lane urban arterial that runs east/west crossing the Freeport Subdivision. Des Plaines Avenue is a four-lane suburban arterial that runs north/south crossing the Freeport Subdivision. Cermak Road is a six-lane divided suburban arterial that runs east/west crossing the

Freeport Subdivision. 1st Avenue/Golfview Avenue (IL 171) is a four-lane divided suburban arterial that runs north/south crossing the Freeport Subdivision. Harlem Avenue (IL 43) and First Avenue (IL 171) operate at LOS E-F and would continue to do so under 2015 conditions. Harlem Avenue and Cermak Avenue operate at LOS ~~C-D~~ E-F and would operate at LOS E-F under 2015 conditions. 26th Street and Des Plaines Avenue operate at LOS D or better and would continue to do so under 2015 conditions.

During the peak period under the No-Action Alternative, Harlem Avenue (IL 43) would experience a calculated vehicle queue length of approximately ~~1,565~~ 1,750 feet, which would block two major streets, 26th Street and Riverside Drive. The queue length along 26th Street would be approximately 715 feet, which would block one major street, Harlem Avenue (IL 43). The queue length along Des Plaines Avenue would be approximately 790 feet, which would block one major roadway Cermak Road. The queue length along Cermak Road would be approximately 1,440 feet, which would block two major roadways, 1st Avenue Cutoff and 1st Avenue/Golfview Avenue (IL 171). The queue length along 1st Avenue/Golfview Avenue (IL 171) would be approximately ~~1,885~~ 1,670 feet, which would block two major roadways, 1st Avenue Cutoff and Cermak Road.

During the peak period under the Proposed Action, Harlem Avenue (IL 43) would experience a queue length of approximately ~~840~~935 feet, which would still block 26th Street and Riverside Drive. The queue length along 26th Street would be reduced to approximately 385 feet, which would no longer block Harlem Avenue (IL 43). The queue length along Des Plaines Avenue would be reduced to approximately 425 feet, which would no longer block Cermak Road. The queue length along Cermak Road would be approximately 770 feet, which would still block 1st Avenue Cutoff. The queue length along 1st Avenue/Golfview Avenue (IL 171) would be approximately ~~1,010~~ 895 feet, which would still block 1st Avenue Cutoff and Cermak Road.

According to IDOT and Cook County, no local roadway improvements are planned that would affect the crossings. Excessive peak hour queuing at these at-grade crossings would have an affect on overall mobility within the area. Reduction of railway operations within the area helps alleviate this issue by eliminating three of the seven major blocked streets. While conditions would improve with the reduction of railway operations, mobility would continue to be affected.

Broadview

Broadview has one roadway that crosses the Freeport Subdivision at-grade and two grade-separated crossings. 17th Avenue is a four-lane urban arterial that runs north/south crossing the Freeport Subdivision. The Village of Broadview Comprehensive Plan mentions roadway improvements on 17th Avenue, but does not specify what these improvements would entail. 17th Avenue operates at LOS ~~C-D~~ A-B and would continue to do so under 2015 conditions.

During the peak period under the No-Action and Proposed Action alternatives, no major intersecting roadways would be blocked by queued vehicles at the crossings.

According to IDOT and Cook County, no local roadway improvements are planned that would affect the 17th Avenue crossing. The at-grade crossing would operate at LOS C-D, providing an acceptable level of overall mobility.

Hillside

Hillside has ~~one~~ two roadways that cross~~es~~ the Freeport Subdivision at-grade and two grade-separated crossings. Wolf Road is a four-lane divided urban arterial that runs north/south crossing the Freeport Subdivision. Harrison Street is a two-lane urban arterial that runs east/west crossing the Freeport Subdivision. Harrison Street and Wolf Road operate at LOS ~~C-D~~ D or better and would continue to do so under 2015 conditions.

During the peak period under the No-Action Alternative, Wolf Road would experience a calculated vehicle queue length of approximately 635 feet, which would block one major street, Harrison Street. During the peak period under the Proposed Action, the calculated peak hour queue length along Wolf Road would be reduced to approximately 330 feet, which would no longer block Harrison Street.

According to IDOT and Cook County, no local roadway improvements are planned that would affect the Wolf Road or Harrison Street crossings. Reduction of railway operations within the area would reduce queues, improve the crossing Level of Service and eliminate blockage of Harrison Street, a major access road for I 290 and I 294.

Elmhurst

Elmhurst has six roadways that cross the Freeport Subdivision at-grade and one grade-separated crossing. York Road is a two-lane urban arterial that runs north/south crossing the Freeport Subdivision. Vallette Street is a two-lane urban collector that runs east/west crossing the Freeport Subdivision. Argyle Avenue is a two-lane urban collector that runs north/south crossing the Freeport Subdivision. Spring Road is a two-lane urban collector that runs north/south crossing the Freeport Subdivision. West St. Charles Road is a two-lane urban arterial that runs east/west crossing the Freeport Subdivision. South West Avenue is a two-lane urban collector that runs north/south crossing the Freeport Subdivision. York Road operates at LOS E-F and would continue to do so under 2015 conditions. Vallette Street, Argyle Avenue, Spring Road, West St. Charles Road, and South West Avenue currently operate at LOS D or better and would continue to do so under 2015 conditions.

During the peak period under both the No-Action and Proposed Action alternatives, no major intersecting roadways would be blocked by the queued vehicles at the crossings.

According to IDOT and DuPage County plans, no local roadway improvements are planned that would affect the crossings. The at-grade crossings operating at LOS C-D in the area provide an acceptable level of overall mobility.

Villa Park

Villa Park has three roadways that cross the Freeport Subdivision at-grade and one grade-separated crossing. Villa Avenue is a two-lane suburban arterial that runs north/south crossing the Freeport Subdivision. Addison Avenue is a four-lane urban arterial that runs north/south crossing the Freeport Subdivision. West North Avenue is a six-lane urban collector that runs east/west crossing the Freeport Subdivision. West North Avenue operates at LOS C-D and would operate at LOS E-F under 2015 conditions. Villa Avenue and Addison Avenue currently operate at LOS D or better and would continue to do so under 2015 conditions. An alternative route to the roadway intersection of Addison Avenue and West North Avenue is the North Ardmore Avenue grade-separated crossing, 0.5 mile to the east of this intersection.

During the peak period under the No-Action Alternative, Addison Avenue would experience a calculated vehicle queue length of approximately 310 feet, which would block one major street, West North Avenue. The queue length along North Avenue (IL 64) would be approximately ~~935~~ 910 feet, which would block one major street, Addison Avenue.

During the peak period under the Proposed Action, Addison Avenue would experience a queue length of approximately 175 feet, which would still block West North Avenue. The queue length along North Avenue (IL 64) would be approximately ~~530~~515 feet, which would still block Addison Avenue.

According to IDOT and DuPage County, no local roadway improvements are planned that would affect the crossings. With West North Avenue operating above capacity, and queuing blocking several major roadways, mobility would be unacceptable in the area.

Addison

Addison has two roadways that cross the Freeport Subdivision at-grade and two grade-separated crossings. Grace Street is a four-lane suburban collector that runs north/south crossing the Freeport Subdivision. Swift Road is a two-lane divided suburban arterial that runs north/south crossing the Freeport Subdivision. Swift Road operates at LOS E-F and would continue to do so under 2015 conditions. Grace Street currently operates at LOS ~~C-D~~ A-B and would continue to do so under 2015 conditions. An alternate route for Swift Road is to use the nearby grade-separated crossing at South Rohlwing Road, 0.5 mile to the east.

During the peak period under the No-Action Alternative, Swift Road would experience a calculated vehicle queue length of approximately 860 feet, which would block one major street, Collins Avenue.

During the peak period under the Proposed Action, Swift Road would experience a queue length of approximately 480 feet, which would block one major street, Collins Avenue.

According to IDOT and DuPage County, no local roadway improvements are planned that would affect the crossings. The existence of a viable grade-separated alternative route to the congested Swift Road would provide an acceptable level of overall mobility to the Addison area.

Bloomingdale

Bloomingdale has three roadways that cross the Freeport Subdivision at-grade. Schmale Road is a four-lane divided suburban arterial that runs north/south crossing the Freeport Subdivision. Gary Avenue is a four-lane divided urban arterial that runs north/south crossing the Freeport Subdivision. Army Trail Road is a four-lane divided urban arterial that runs east/west crossing the Freeport Subdivision. Schmale Road, Gary Avenue, and Army Trail Road operate at LOS C-D and would operate at LOS E-F under 2015 conditions.

During the peak period under the No-Action Alternative, Gary Avenue would experience a calculated vehicle queue length of approximately 1,060 feet, which would block one major street, Army Trail Road.

During the peak period under the Proposed Action, Gary Avenue would experience a calculated vehicle queue length of approximately 565 feet, which would still block Army Trail Road.

According to IDOT and DuPage County, no local roadway improvements are planned that would affect the crossings. The reduction of railway operations would improve the queuing; however, the poor LOS would affect the level of overall mobility for the Bloomingdale area.

Hanover Park

Hanover Park has one roadway that crosses the Freeport Subdivision at-grade and two grade-separated crossings. Under DuPage County's Comprehensive Road Improvement Plan, Jefferson Street/County Farm Road widens from a four-lane urban arterial to a six-lane urban arterial. Jefferson Street/County Farm Road operates at LOS C-D and would ~~continue to do so under 2015 conditions.~~ operate at LOS E-F under 2015 conditions.

During the peak period under both the No-Action and Proposed Action alternatives, no major intersecting roadways would be blocked by the queued vehicles at the crossings.

DuPage County's plans to widen Jefferson Street/County Farm Road would improve the roadway network, providing an acceptable level of overall mobility.

Bartlett

Bartlett has two roadways that cross the Freeport Subdivision at-grade. Sutton Road (IL 59) is a four-lane suburban arterial that runs north/south crossing the Freeport Subdivision. Powis Road is a two-lane rural collector that runs north/south crossing the Freeport Subdivision. Munger Road parallels Sutton Road (IL 59) by approximately 4,750 feet to the west, providing a potential alternative route to the congested Sutton road (IL 59). Sutton Road (IL 59) currently operates at LOS E-F and would continue to do so under 2015 conditions. Powis Road currently operates at LOS ~~C-D~~ A-B and would ~~continue to do so~~ operate at LOS C-D under 2015 conditions.

During the peak period under both the No-Action and Proposed Action alternatives, no major intersecting roadways would be blocked by the queued vehicles at the crossings.

According to IDOT and DuPage County, no local roadway improvements are planned that would affect the crossings. The roadway network would provide an acceptable level of overall mobility.

South Elgin

South Elgin has two roadways that cross the Freeport Subdivision at-grade and six grade-separated crossings. IL 25 is a two-lane rural arterial that runs north/south crossing the Freeport Subdivision. Randall Road is a four-lane suburban arterial that runs north/south crossing the Freeport Subdivision. Randall Road operates at LOS E-F and would continue to do so under 2015 conditions. IL 25 currently operates at LOS D or better and would continue to do so under 2015 conditions. Dunham Road, approximately 0.5 mile east of IL 25, provides a grade-separated alternative route. McDonald Road and Hopps Road, 0.5 mile east and west of Randall Road, provide grade-separated alternative routes.

According to IDOT and DuPage County, no local roadway improvements are planned that would affect the crossings. While the two at-grade crossings would operate above capacity, the six grade-separated crossings would provide viable alternative routes and help provide an acceptable level of overall mobility to the roadway network.

Joliet Subdivision

The Proposed Action would not affect the overall mobility in the following five communities along CN's Joliet Subdivision because all of the crossings in these communities are grade-separated:

- Chicago (19 grade-separated crossings)
- Forest View (two grade-separated crossings)
- Summit (two grade-separated crossings)
- Bedford Park (one grade-separated crossing)
- Willow Springs (four grade-separated crossings)

Lemont

Lemont has ~~four~~ three roadways that cross the Joliet Subdivision at-grade in close proximity to each other and one grade-separated crossing. Pruxne Street is a two-lane divided collector that runs north/south crossing the Joliet Subdivision east of the village center. Holmes Street is a two-lane collector that runs north/south crossing the Joliet Subdivision within the village center. Stephen Street is a two-lane collector that runs north/south crossing the Joliet Subdivision within the village center. ~~Lemont Street is a two-lane collector that runs north/south crossing the Joliet Subdivision within the village center. Lemont~~ Stephen Street would operate at LOS E-F, while Pruxne Street and,Holmes Street ~~and Stephen Street~~ would operate at LOS C or better. ~~Stephen Street parallels Lemont Street by approximately 450 feet to the northeast and would provide the additional capacity needed to be a viable alternative route to the congested Lemont Street.~~During the peak period under

the No-Action Alternative, Pruxne Street would experience a calculated vehicle queue length of approximately 445 feet, which would block one major roadway, Main Street. The queue length along Stephen Street would be approximately ~~180~~ 925 feet, which would block one major roadway, Main Street. ~~The queue length along Lemont Street would be approximately 2,320 feet, which would block two major roadways, Main Street and East Illinois Street.~~

During the peak period under the Proposed Action, Pruxne Street would experience a calculated vehicle queue length of approximately 410 feet, which would still block Main Street. The queue length along Stephen Street would be approximately ~~165~~850 feet, which would still block Main Street~~. The queue length along Lemont Street would be approximately 2,480 feet, which would still block, Main Street and East Illinois Street.~~ The LOS of the viable alternative routes would be C or better; however, long queues would block a number of major streets; therefore, the overall mobility of the network would be affected.

- Based on the updated analysis, Lemont Street is not included in the list of roadways for Lemont since it does not meet the SEA criteria of a projected 2015 ADT of greater than 2,500 vpd. Therefore, Lemont has changed from having four roadways to three roadways that cross the Joliet Subdivision at-grade, as part of the analysis.

Romeoville

Romeoville has one roadway that crosses the Joliet Subdivision at-grade. Romeoville Road (135th Street) is a two-lane arterial that runs east/west crossing the Joliet Subdivision east of the village center. Romeoville Road (135th Street) would operate at LOS E-F. No potential alternative routes exist within one mile of the Romeoville Road (135th Street) at-grade crossing.

During the peak periods under both the No-Action and Proposed Action alternatives, no major intersecting roadways would be blocked by the queued vehicles at the crossing. No local roadway improvements are planned within the Village of Romeoville. The lack of potential alternative routes within one mile of the Romeoville Road (135th Street) at-grade crossing would continue to affect the overall mobility in the area.

Lockport

Lockport has seven roadways that cross the Joliet Subdivision at-grade in close proximity to each other and one grade-separated crossing. Second Street is a two-lane collector that runs east/west crossing the Joliet Subdivision north of the village center. Sixth Street is a two-lane collector that runs east/west crossing the Joliet Subdivision within the village center. Ninth Street (IL 7) is a two-lane arterial that runs east/west crossing the Joliet Subdivision within the village center. Tenth Street is a two-lane collector that runs east/west crossing the Joliet Subdivision within the village center. Eleventh Street is a two-lane collector that runs east/west crossing the Joliet Subdivision within the village center. Thirteenth Street is a two-lane collector that runs east/west crossing the Joliet Subdivision within the village center and intersecting one collector, Division Street. Division Street is a two-lane collector that runs east/west crossing the Joliet Subdivision within the village center and intersecting one local street, 13th Street. The at-grade crossing at 9th Street (IL 7) would operate at LOS F. All other at-grade crossings would operate at LOS B or higher.

During the peak period under the No-Action Alternative, 9th Street would experience a calculated vehicle queue length of approximately ~~1,520~~ 1,600 feet, which would block one major roadway, South State Street. The queue length along Division Street would be approximately 345 feet, which would also block South State Street.

During the peak period under the Proposed Action, 9th Street would experience a calculated vehicle queue length of approximately ~~1,880~~ 1,975 feet, which would still block South State Street. The

calculated queue length along Division Street would be approximately ~~420~~ 425 feet, which would also still block South State Street. No local roadway improvements are planned within the Village of Lockport. The existence of viable alternative routes to the congested 9th Street would provide an acceptable level of overall mobility to the area.

Joliet

Joliet has two roadways that cross the EJ&E rail line at-grade and 10 grade-separated crossings. Ohio Street and Jackson Street would operate at LOS D or better.

During the peak period under the No-Action Alternative, Ohio Street would experience a calculated vehicle queue length of approximately ~~365~~ 1,045 feet, which would block ~~one~~ two major roadways, Scott Street (NB IL 53) and Chicago Street (SB IL 53). The queue length along Jackson Street would be approximately ~~1,025~~ 1,480 feet, which would block two major roadways, Scott Street (NB IL 53) and Ottawa Street (SB IL 53).

During the peak period under the Proposed Action, Ohio Street would experience a queue length of approximately ~~450~~ 1,340 feet, which would still block Scott Street (NB IL 53) and Chicago Street (SB IL 53). The queue length along Jackson Street would be approximately ~~1,265~~ 1,900 feet, which would still block Scott Street (NB IL 53) and Ottawa Street (SB IL 53), as well as Collins Street (IL 171/US 6).

Lincoln Highway (US 30), a four-lane divided arterial with a grade-separated crossing, parallels both Ohio Street and Jackson Street less than a mile to the south and may provide the available capacity to alleviate queuing along these roadways. The availability of a viable alternative route and the multiple grade-separated crossings, as well as the at-grade crossings operating at LOS D or better in the area, provide an acceptable level of overall mobility.

Chicago Subdivision

The Proposed Action would not affect the overall mobility in the following 10 communities along CN's Chicago Subdivision because all of the crossings in these communities are grade-separated:

- Chicago (45 grade-separated crossings)
- Riverdale (three grade-separated crossings)
- Harvey (seven grade-separated crossings)
- East Hazelcrest (two grade-separated crossings)
- Homewood (two grade-separated crossings)
- Flossmoor (two grade-separated crossings)
- Olympia Fields (two grade-separated crossings)
- Matteson (two grade-separated crossings)
- ~~Richton Park (two grade-separated crossings)~~
- Monee (three grade-separated crossings)

Richton Park

Richton Park has one roadway that cross the Chicago Subdivision at-grade and two grade-separated crossings. Stuenkel Road/University Parkway runs east/west crossing the Chicago Subdivision and intersecting four arterials: La Grange Road (US 45), I 57, South Cicero Avenue (IL 50), and South Governors Highway. Stuenkel Road/University Parkway operates at LOS E-F and will continue to do so under 2015 condittions.

During the peak period under the No-Action Alternative, Stuenkel Road/University Parkway would experience a calculated vehicle queue length of approximately 320 feet, which would block one major roadway, South Governors Highway (IL 50).

During the peak period under the Proposed Action, Stuenkel Road/University Parkway would experience a calculated vehicle queue length of approximately 320 feet, which, although likely reduced due to a planned widening, would still block South Governors Highway (IL 50).

According to the Will County and IDOT plans, no local roadway improvements are planned within the Village core. However, Will County's Recommended Transportation Plan suggests that Stuenkel Road/University Parkway widens from a two-lane undivided collector to a four-lane divided arterial. The Will County plan also calls for an interchange to be added off of I-57 on Stuenkel Road/University Parkway. This improvement may have a positive effect on the operations of Stuenkel Road/University Parkway within the Village core and would provide an alternate route to South Governors Highway during periods of rail use. The widening of Stuenkel Road/University Parkway would improve the LOS from E-F to LOS C-D. With the widening, the roadway network would provide an acceptable level of overall mobility.

University Park

University Park has~~two~~ one roadway~~s~~ that crosses the Chicago Subdivision at-grade ~~in close proximity to each other~~. There are no grade-separated crossings. ~~Stuenkel Road/University Parkway runs east/west crossing the Chicago Subdivision and intersecting four arterials: La Grange Road (US 45), I-57, South Cicero Avenue (IL 50), and South Governors Highway~~. West Dralle Road is a two-lane divided collector that runs east/west, west of the railway, and turns south just east of the railway where it resumes as a two-lane undivided collector that runs east/west approximately 1,300 feet south of the west leg. West Dralle Road operates at LOS A-B and will continue to do so under 2015 conditions.

~~During the peak period under the No-Action Alternative, Stuenkel Road/University Parkway would experience a calculated vehicle queue length of approximately 530 feet, which would block one major roadway, South Governors Highway (IL 50). The queue length along West Dralle Road would be approximately 155 feet, which would also block South Governors Highway (IL 50).~~

~~During the peak period under the Proposed Action, Stuenkel Road/University Parkway would experience a calculated vehicle queue length of approximately 425 feet, which, although likely reduced due to a planned widening, would still block South Governors Highway (IL 50). The queue length along West Dralle Road would be approximately 125 feet, which would also still block South Governors Highway (IL 50).~~ According to the Will County and IDOT plans, no local roadway improvements are planned within the Village core, aside from surface reconstruction. The at-grade crossing would operate at LOS B or better in the area, providing an acceptable level of overall mobility. ~~However, Will County's Recommended Transportation Plan suggests that Stuenkel Road/University Parkway widens from a two-lane undivided collector to a four-lane divided arterial. The Will County plan also calls for an interchange to be added off of I-57 on Stuenkel Road/University Parkway. This improvement may have a positive effect on the operations of Stuenkel Road/University Parkway within the Village core and would provide an alternate route to South Governors Highway during periods of rail use. The widening of Stuenkel Road/University Parkway would improve the LOS from E-F to LOS A-B. With the widening, the roadway network would provide an acceptable level of overall mobility.~~

- Based on the updated analysis, Stuenkel Road/University Parkway has been re-designated from Univesity Park to Richton Park. Therefore, University Park has changed from having two roadways to one roadway that crosses the Chicago Subdivision at-grade, as part of the analysis.
- West Dralle Road operates at LOS A-B and will continue to do so under 2015 conditions.

- The at-grade crossing would operate at LOS B or better in the area, providing an acceptable level of overall mobility.

Elsdon Subdivision

Chicago

Chicago has 10 roadways that cross the Elsdon Subdivision at-grade and 34 grade-separated crossings. The local and regional planning documents do not designate planned improvements near the at-grade crossings that would affect mobility. Under 2015 conditions, the crossings at 55th Street, 71st Street, and 115th Street would all operate at LOS E-F, which remains unchanged from the 2007 conditions. Since 51st and 58th Streets parallel 55th Street by approximately 0.5 mile and 0.4 mile, respectively, 51st and 58th Streets both provide alternative routes to the congested 55th Street. Likewise, since 67th Street parallels 71st Street by approximately 0.5 mile, 67th Street provides an alternative route to the congested 71st Street. Finally, since 111th and 119th Streets parallel 115th Street by approximately 0.5 mile each, 111th and 119th Streets both provide alternative routes to the congested 115th Street. All other crossings in Chicago would operate at LOS D or better under 2015 conditions. The Metra SWS commuter rail line has an at-grade crossing with the Elsdon Subdivision within the community.

During the peak period under the No-Action Alternative, 55th Street and 71st Street would experience calculated queue lengths of approximately 2,635 feet and 2,785 feet respectively, which would block one major roadway, Pulaski Road. The queue length along 79th Street would ~~experience a calculated vehicle queue length of~~ be approximately 2,455 feet, which would block one major roadway, Columbus Avenue. The queue lengths along 103rd Street and 111th Street would be approximately 1,995 feet and 1,645 feet, respectively, which would block one major roadway, Kedzie Avenue.

During the peak period under the Proposed Action, ~~these queue lengths would be reduced such that no major roadways would be impeded.~~55th Street and 71st Street would experience calculated queue lengths of approximately 2,635 feet and 2,785 feet respectively, which would still block Pulaski Road. The queue lengths along 79th Street, 103rd Street, and 111th Street would be reduced such that no major roadways would be impeded. ~~Therefore,~~The close proximity of alternative crossing routes and available capacity at existing crossing locations allow for ~~good~~acceptable overall mobility.

Evergreen Park

Evergreen Park has five roadways that cross the Elsdon Subdivision at-grade. The local and regional planning documents do not designate planned improvements near the at-grade crossings that would affect mobility. 91st Street, Kedzie Avenue, 94th Street, and 95th Street would operate at LOS D or better under 2015 conditions. Under 2015 conditions, the crossing at 99th Street would operate at LOS E-F, which is a decrease from LOS C-D under 2007 conditions.

During the peak period under the No-Action Alternative, Kedzie Avenue would experience a calculated vehicle queue length of approximately ~~2,365~~ 2,415 feet, which would block one major roadway, 95th Street (US 12). The queue lengths along 95th Street (US 12) and 99th Street would be approximately ~~2,045~~ 1,550 feet and 1,945 feet, respectively, which would block Kedzie Avenue.

During the peak period under the Proposed Action condition, the queue lengths would be reduced due to the reduction of trains traveling on the Elsdon Subdivision, such that no major streets would be impeded. Thus, despite the congested conditions at the 99th Street crossing, mobility in the Evergreen Park area would be improved.

Blue Island

Blue Island has four roadways that cross the Elsdon Subdivision at-grade and two grade-separated crossings. The local and regional planning documents do not designate planned improvements near the at-grade crossings that would affect mobility. Under 2015 conditions, the crossing at 119th Street would operate at LOS E-F, which is a decrease from LOS C-D under 2007 conditions. 123rd Street, 127th Street, and Broadway would operate at LOS D or better under 2015 conditions.

During the peak period under the No-Action Alternative, 119th Street would experience a calculated vehicle queue length of approximately 2,405 feet, which would block one major roadway, Kedzie Avenue. The queue length along 127th Street would be approximately 2,315 feet, which would block Kedzie Avenue, and one railroad crossing to the east.

During the peak period under the Proposed Action, these queue lengths would be reduced such that no major roadways would be impeded. Thus, despite the congested conditions at the 119th Street crossing, mobility in the Blue Island area would be improved.

Dixmoor

Dixmoor has two roadways that cross the Elsdon Subdivision at-grade and one grade-separated crossing. Western Avenue and Robey Street would operate at LOS B or better under the 2015 conditions. The local and regional planning documents do not designate planned improvements near the at-grade crossings that would affect mobility.

During the peak period under both the No-Action and Proposed Action alternatives, no major intersecting roadways would be blocked by the queued vehicles at the crossings. The multiple grade-separated crossings, as well as the at-grade crossings would operate at LOS B or better in the area, providing an acceptable level of overall mobility.

Harvey

Harvey has ~~seven~~eight roadways that cross the Elsdon Subdivision at-grade. The local and regional planning documents do not designate planned improvements near the at-grade crossings that would affect mobility. Under 2015 conditions, the crossing at Sibley Boulevard/147th Street (IL 83) would operate at LOS E-F, which is a decrease from LOS C-D under 2007 conditions. Under 2015 conditions, the crossing at Ashland Avenue would operate at LOS E-F, which would remain unchanged from the 2007 conditions. Lincoln Avenue, Wood Street, Center Street, Broadway Street, Park Avenue, and Halsted Street (IL 1) would operate at LOS C or better under 2015 conditions.

During the peak period under the No-Action Alternative, Wood Street would experience a calculated vehicle queue length of approximately 565 feet, which would block one major roadway, Sibley Boulevard/147th Street (IL 83). The queue length along Sibley Boulevard/147th Street (IL 83) would be approximately ~~1,240~~ 1,200 feet, which would block one major roadway, Wood Street. The queue length along Ashland Avenue would be approximately 1,000 feet which would block one major roadway, Sibley Boulevard/147th Street (IL 83)

During the peak period under the Proposed Action, Wood Street would experience a queue length of approximately 405 feet, which would still block Sibley Boulevard/147th Street (IL 83). The queue length along Sibley Boulevard/147th Street (IL 83) would be approximately ~~885~~ 860 feet, which would still block Wood Street. The queue length along Ashland Avenue would be approximately 715 feet, which would still block Sibley Boulevard/147th Street (IL 83). Despite the congested conditions around the crossings at Sibley Boulevard/147th Street (IL 83) and Ashland Avenue, overall mobility is adequate in the Harvey area.

- Based on the updated analysis, Ashland Avenue is included in the list of roadways for Harvey since it meets the SEA criteria for required evaluation. Therefore, Harvey

has changed from having seven roadways to eight roadways that cross the Elsdon Subdivision at-grade, as part of the analysis.

Phoenix

Phoenix has one roadway that crosses the Elsdon Subdivision at-grade. 155th Street would operate at LOS A-B, under the 2015 condition. The local and regional planning documents do not designate planned improvements near the crossing that would affect mobility.

During the peak period under No-Action and Proposed Action alternatives, no major intersecting streets would be blocked by the queued vehicles at the crossing. The multiple grade-separated crossings, as well as the at-grade crossing would operate at LOS A-B in the area, providing an acceptable level of overall mobility.

South Holland

South Holland has four roadways that cross the Elsdon Subdivision at-grade and two grade-separated crossings. The local and regional planning documents do not designate planned improvements near the at-grade crossings that would affect mobility. Under 2015 conditions, the crossing at 162nd/ 159th Street (US 6) would operate at LOS E-F, which is a decrease from LOS C-D under 2007 conditions. Thornton-Blue Island Road, South Park and 170th Street would operate at LOS C or better under 2015 conditions. The proposed Metra southeast commuter rail line has an at-grade crossing with the Elsdon Subdivision within the community.

During the peak period under the No-Action Alternative, 159th Street (US 6) would experience a calculated vehicle queue length of approximately 1,055 feet, which would block one major roadway, Vincennes Avenue, and a railroad crossing to the west.

During the peak period under the Proposed Action, 159th Street (US 6) would experience a queue length of approximately 1,025 feet, which would still block Vincennes Avenue, and a railroad crossing to the west. The multiple grade-separated crossings, as well as most of the at-grade crossings, would operate at LOS C-D in the area, providing an acceptable level of overall mobility.

Thornton

Thornton has one roadway, Thornton-Lansing Road, which crosses the Elsdon Subdivision at-grade and one grade-separated crossing. The local and regional planning documents do not designate planned improvements near the at-grade crossing that would affect mobility. Under 2015 conditions, the crossing at Thornton-Lansing Road would operate at LOS E-F, which would remain unchanged from the 2007 conditions. Ridge Road parallels Thornton-Lansing Road by approximately 0.65 mile, providing an alternative route to the congested Thornton-Lansing Road.

During the peak period under both the No-Action and Proposed Action alternatives, no major intersecting roadways would be blocked by queued vehicles at the crossing. Therefore, the close proximity of alternative crossing routes and available capacity at existing crossing locations allow for good overall mobility.

Lansing

Lansing has ~~five~~six roadways that cross the Elsdon Subdivision at-grade. The local and regional planning documents do not designate planned improvements near the at-grade crossings that would affect mobility. Under 2015 conditions, the crossing at Wentworth Avenue would operate at LOS E-F, which is a decrease from LOS C-D under 2007 conditions. Volbrecht Road, 182nd Street/Ridge Road, Torrence Avenue (ILL 83), 186th Street and Burnham Avenue would operate at LOS ~~C~~ D or better under 2015 conditions.

During the peak periods under both the No-Action and Proposed Action alternatives, no major intersecting roadways would be blocked by queued vehicles at the crossing. Despite the congested conditions around the crossing at Wentworth Avenue, overall mobility is adequate in the Lansing area.

- Based on the updated analysis, 182nd Street/Ridge Road is included in the list of roadways for Lansing since it meets the SEA criteria for required evaluation. Therefore, Lansing has changed from having five roadways to six roadways that cross the Elsdon Subdivision at-grade, as part of the analysis.

Munster, Indiana

Munster has two roadways that cross the Elsdon Subdivision at-grade. Northwestern Indiana Regional Planning Commission's transportation program calls for the addition of a center turn lane on Calumet Avenue between Fisher Street and 45th Avenue. This improvement, however, would not affect the roadway LOS. Under 2015 conditions, the crossings at Calumet Avenue and White Oak Avenue would both operate at LOS E-F, which is a decrease from LOS C-D under 2007 conditions. Indianapolis Boulevard (US 41), a four-lane divided arterial with a grade-separated crossing, parallels White Oak Avenue approximately 1.0 mile to the east and may provide the available capacity to be a viable alternative route for the congested White Oak Avenue.

During the peak period under both the No-Action and Proposed Action alternatives, no major intersecting roadways would be blocked by queued vehicles at the crossing. Mobility is somewhat impeded in the Munster area at the at-grade crossings.

Highland, Indiana

Highland has one roadway, Kennedy Avenue, which crosses the Elsdon Subdivision at-grade and one grade-separated crossing. The local and regional planning documents do not designate planned improvements near the at-grade crossing that would affect mobility. Under 2015 conditions, Kennedy Avenue would operate at LOS A-B.

During the peak period under both the No-Action and Proposed Action alternatives, no major intersecting roadways would be blocked by queued vehicles at the crossing. The grade-separated crossing, as well as the at-grade crossing, would operate at LOS B in the area, providing an acceptable level of overall mobility.

Griffith, Indiana

The Griffith community has three roadways that cross the Elsdon Subdivision at-grade. Under 2015 conditions, ~~all three~~ the crossings at ~~(Main Street,~~ Broad Street and Colfax Street~~)~~ would operate at LOS E-F, which would remain unchanged from the 2007 conditions. ~~The roadways operated at LOS C, LOS D, and LOS E-F under 2007 conditions, respectively.~~ Under 2015 conditions, Main Street would operate at LOS C-D, which would remain unchanged from the 2007 conditions.

During the peak period under the No-Action Alternative, Broad Street would experience a calculated vehicle queue length of approximately ~~2,140~~ 1,185 feet, which would block one major roadway, Main Street.

During the peak period under the Proposed Action, ~~this queue length would be reduced such that no major roadways would be impeded.~~ Broad Street would experience a queue length of approximately 1,150 feet, which would still block Main Street.

The local and regional planning documents do not designate planned improvements near the at-grade crossings that would affect mobility. ~~The reduction of railway operations would improve~~ Excessive

peak hour queuing along Broad Street and ~~however~~ the poor LOS would affect the level of overall mobility for the Griffith community.

Merrillville, Indiana

Merrillville has three roadways that cross the Elsdon Subdivision at-grade and two grade-separated crossings. The local and regional planning documents do not designate planned improvements near the at-grade crossings that would affect mobility. Under 2015 conditions, the crossings at Taft Street and Broadway would both operate at LOS E-F, which is the same under 2007 conditions. Madison Street would operate at LOS C-D under the 2015 conditions. Since Hendricks Street parallels Taft Street by approximately 4,000 feet and Harrison Street parallels Broadway by approximately 2,000 feet, Hendricks Street and Harrison Street both provide alternative routes to the congested Taft Street and Broadway Street, respectively. Therefore, the close proximity of alternative crossing routes and available capacity at existing crossing locations allow for good overall mobility.

Corrections to Attachment E3 of the Draft EIS

Effects on Emergency Service Response

E3.1 Background

In the Draft EIS, SEA reviewed vehicular delays at highway/rail at-grade crossings as a result of increases in rail-related operations to determine the potential effects of the demands placed on emergency services in the communities within the Study Area. These emergency service facilities included police, fire protection, and emergency medical services. Estimates of typical delays at highway/rail at-grade crossings were made for all of the public at-grade crossings along the EJ&E Eastern and Western Subdivisions and the CN Waukesha, Freeport, Joliet, Chicago, and Elsdon/South Bend Subdivisions. Only those emergency service facilities meeting the threshold parameters of being within two miles of at least one highway/rail at-grade crossing and having train traffic increases or decreases equal to or in excess of eight trains per day were identified and evaluated. Vehicular delays at these grade crossings were evaluated based on the average number of trains, train length, and speed in that particular area. Tables showing Average Daily Traffic (ADT) counts, existing and proposed number of trains, average delay per delayed vehicle and total time that a crossing is blocked in a 24-hour period were prepared for all of these facilities and presented in Appendix Attachment E3 of the Draft EIS.

Following publication of the Draft EIS, SEA received many comments concerning the basis for its conclusions, as well as the status of particular crossings. Some of these comments questioned the validity of ADTs used in the Draft EIS and growth rate factors used to forecast future ADTs. SEA worked with IDOT, local agencies, and communities to obtain updated ADTs. SEA also made appropriate adjustments to the train operations data used in the transportation and rail operations analysis. A full discussion of the updated transportation information and analysis is provided in Section 2.5 of this Final EIS.

Since this revised information affected many of the tables in Appendix Attachment E3 of the Draft EIS, a revised Appendix Attachment E3 has been prepared for this Final EIS. SEA looked at all of the facility tables identified in the Appendix Attachment E3 of the Draft EIS with the revised information, and concluded that no conclusions of potentially substantially affected facilities changed based on these revised tables. Therefore, SEA determined that it is unnecessary to republish all of these tables and instead only published the revised tables for those facilities that were considered potentially substantially affected by the Proposed Action in the Draft EIS and those facilities identified as needing additional analysis (see Section 2.6 of this Final EIS). The revised vehicular delay information found in Appendix A of this Final EIS shows all of the highway/rail at-grade crossings that have been updated with revised information.

The layout of the following sections is as follows:

- Section E3.2 provides the revised tables of those facilities identified as being potentially substantially affected by the Proposed Action in the Draft EIS
- Section E3.3 provides the revised tables (and new tables for Advocate Good Shepherd Hospital, Edward Hospital, Edward Plainfield Outpatient Center & Immediate Care, and Silver Cross Replacement Hospital) of those facilities identified as needing additional analysis

Since some of the facilities identified as needing additional analysis were outside of the two-mile threshold parameter (Advocate Good Shepherd Hospital, Edward Hospital and Silver Cross Replacement Hospital), tables were prepared that show the highway/rail crossings within five miles of the facility's location.

Table E3.1-1 below provides the heading descriptions for the subsequent tables to follow in Sections E3.2 and E3.3. US DOT numbers are included in these tables to serve as a unique identifier for an individual roadway crossing for instances when the rail line crosses the same roadway more than once.

TABLE E3.1-1. LEGEND FOR TABLES OF CROSSINGS WITHIN TWO MILES OF EMERGENCY SERVICES FACILITIES

Heading	Description
US DOT	US DOT number from FRA database
MP	Mile Post
N	Number of trains per day
ADT	Average daily traffic, at-grade intersection
D_A	Average delay per delayed vehicle, minutes
T	Total Time crossing is blocked in a day, minutes

E3.2 Substantially Affected Emergency Service Providers Identified in DEIS

Table E3.2-1 below corrects Tables E3.9-3, E3.10-5, E3.11-2 and E3.12-6, and identifies the nine public crossings within two miles of Countryside Fire Protection District – Station No. 1 that can be utilized in order to serve the community south of the EJ&E rail line and east of the CN rail line Waukesha Subdivision. Seven of these nine crossings are at-grade crossings. The nearest EJ&E grade separated crossing to Countryside Fire Protection District – Station No. 1 is ~~US Route 45~~ Lake Street (US 45), approximately 1.5 miles southeast, while the nearest CN grade separated crossing is Countryside Highway/Courtland Street, approximately 1.5 miles northeast.

~~TABLE E3.9-3, TABLE E3.10-5, TABLE E3.11-2, TABLE E3.12-6,~~ TABLE E3.2-1. CROSSINGS WITHIN TWO MILES OF COUNTRYSIDE FIRE PROTECTION DISTRICT - STATION NO. 1

Table E3.2-7 on the next page corrects Tables E3.31-4, E3.32-4, E3.33-3, E3.82-4, E3.84-4 and E3.85-4, and identifies the six public crossings within two miles of the Saint James Hospital and Health Centers – Olympia Fields that can be utilized in order to serve the community south of the EJ&E rail line and east of the CN rail line Chicago Subdivision. One of these six crossings is an at-grade crossing. The nearest EJ&E grade separated crossing to the Saint James Hospital and Health

Centers – Olympia Fields is ~~Governor's~~ Governors Highway, approximately 2 miles south, while the nearest CN grade separated crossing is Lincoln Highway ~~(US 30)~~ (US 30), approximately 1.5 miles southeast.

~~TABLE E3.31-4, TABLE E3.32-4, TABLE E3.33-3, TABLE E3.82-4, TABLE E3.84-4, TABLE E3.85-4,~~ TABLE E3.2-7. CROSSINGS WITHIN TWO MILES OF SAINT JAMES HOSPITAL AND HEALTH CENTERS - OLYMPIA FIELDS

Note:

[b] This crossing is comprised of a mainline track, a south connector, and a north connector, all of which were individually analyzed for the effects of the Proposed Action. The crossing displayed here shows the sum total of the number of trains (N), and total time that the crossing is blocked in a 24-hr period (T). The average delay per delayed vehicle (D_A) is the weighted average of the average delay per delayed vehicle (D_A) for the mainline, north connector, and the south connector.

Table E3.2-8 on the next page corrects Tables E3.34-3, E3.35-7, E3.82-3, E3.83-1, E3.96-4 and E3.97-4, and identifies the eight public crossings within two miles of ~~The~~ the Saint James Hospital and Health Centers – Chicago Heights that can be utilized in order to serve the community south of the EJ&E rail line. Seven of these eight crossings are at-grade crossings. The nearest EJ&E grade separated crossing to ~~The~~ the Saint James Hospital and Health Centers – Chicago Heights is Butler Street, approximately 0.75 mile southeast; however, ~~the nearest grade separated crossing that can accommodate all emergency medical vehicles is Calumet Expressway (IL-394), approximately 3 miles east~~ this crossing has clearance restrictions that may not accommodate all emergency service apparatus and so SEA assumed this crossing could not be used by any emergency service responder. Therefore, the nearest accessible EJ&E grade separated crossing that can accommodate all emergency vehicles is Orchard Drive, approximately 2.5 miles west.

Griffith, IN	Griffith Volunteer Fire Dept. - Station No. 2	260656M	Indianapolis Boulevard (US 41)	2.29	Y (57)	Y (80)	4.3-22

Notes:

[a] The delay time shown in the table reflects the greatest increase in delay calculated for all available routes from the facility.

[b] This facility is closer to Butler Street; however, there are clearance restrictions at this crossing and it may not accommodate all emergency service apparatus; essentially assuming that this crossing cannot be used by any emergency service responder.

Noise

Corrections to APPENDIX L of the Draft EIS
NOISE AND VIBRATION ANALYSIS

Page L-6, third paragraph:

Tests have shown locomotive noise to change by approximately 2 dBA for each one-step change in throttle setting. As the engineer moves the locomotive throttle from notch one to notch eight, noise levels increase by an average of 16 dBA. Because locomotive engineers constantly adjust throttle setting as necessary, only rough estimates of throttle settings are usually available for noise projections. SEA assumed a base throttle position of ~~six~~ eight unless they obtain more specific information.

Corrections to APPENDIX M of the Draft EIS
BIOLOGICAL RESOURCES ANALYSIS

Page M-10, second paragraph:

Sauk Trail Woods and Indian Hill Woods Forest Preserve, part of the Thorn Creek Trail System, are on opposite sides of EJ&E Segment 6. The preserves contain Sauk Lake and Thorn Creek, plus miles of paved bike trails and off-trail dirt paths. Sauk Trail Woods contains numerous ravines and valleys and is mostly dense upland forest. No construction is planned for this segment of the EJ&E. However, the Applicants propose to increase traffic on the segment from 8.6 to 31.6 trains per day. ~~Since this area is not being managed for wildlife or habitat,~~ The existing condition along the EJ&E corridor consists of mired heavy industry and established residential development at a narrow point in forest preserve holdings. SEA anticipates minimal impacts from increased noise and vibration and animal/train collisions on wildlife and/or habitat. Maintenance on the rail embankment through the preserve is expected to be similar to current practices.

Page M-12, Table M.3.2-1:

Table M.3.2-1. Natural Areas with No Impacts from Proposed Action

Natural Areas	Justification for Decision (Existing Community Types)
Lake County, Illinois	
Mundelein Park and Recreation District	Recreational open space park
Cook County, Illinois (West Subdivision)	
Crabtree Nature Center Forest Preserve; INAI 0266	Forested area across major roadway (Route 59) from EJ&E rail line; (marsh/forest)
DuPage County, Illinois	
Dunham Forest Preserve	EJ&E rail line runs adjacent to cornfield; (agricultural field)
Illinois Natural History Survey (INHS) Railroad Prairie (Site 20)	No construction; appears as though most of area has been developed; (prairie remnant)
Blackwell Forest Preserve	EJ&E rail line adjacent to natural area fragmented by residential areas; (marsh/grassland)
Big Woods Forest Preserve	Site across industrial/commercial area from EJ&E rail line; (marsh/grassland)
Country Lakes Forest Preserve	EJ&E rail line across from highly fragmented area (industrial/residential divide); (marsh)
~~Night Heron Marsh Forest Preserve~~	~~Rookery is surrounded by Eola Road and Liberty Street and existing rail yards; (marsh/rookery)~~
Will County, Illinois	
Vermont Cemetery Prairie Nature Preserve; INAI 10803	Fragmented, rail line may protect from development; (high quality dry-mesic prairie)
INHS Railroad Prairie (Site 27)	About 0.25 mile from EJ&E rail line; poor-quality prairie remnant, appears unmaintained; (remnant prairie)
INHS Railroad Prairie (Site 28)	East of EJ&E rail line; appears to be largely disturbed (new housing, tilled field, overgrown woods; (remnant prairie)
INHS Railroad Prairie (Site 29)	Prairie appears to be poor quality, mostly farmed and maintained under power corridor; (remnant prairie)
Alessio Prairie Forest Preserve	Commercial, roadway and residential areas between rail line and preserve; (grassland)
Kraske Forest Preserve	Commercial, roadway and residential areas between rail line and preserve; (grassland)
Walnut Hollow Forest Preserve	Located across rail yard; (forest)
Sauk Trail Reservoir Forest Preserve	Fragmented corridor through residential development to preserve (xx)
Old Plank Road Trail2	No quality habitat between trail and rail line; (grassland)

Table M.3.2-1. Natural Areas with No Impacts from Proposed Action	
Natural Areas	**Justification for Decision (Existing Community Types)**
Cook County, Illinois (East Subdivision)	
Butterfield Creek Headwaters Land and Water Reserve, INAI 0540, Old Plank Road Prairie, and Old Plank Road Nature Preserve	Nature preserve areas 0.5 mile from proposed change in traffic; (prairie)
Sauk Village Railroad Prairie; INAI Site 05423	Fragmented; rail line may protect from development; (dry-mesic prairie)
Plum Creek Forest Preserve	Adjacent to EJ&E rail line (south of tracks); former gravel quarry adjacent to residential development, fragmented from the core of preserve by East Sauk Trail Road (open water, wetland, forest, Shrubland)
Lake County, Indiana	
High-quality natural community (unnamed site A)	Adjacent to EJ&E rail line (north of tracks); adversely affected by recent road building; small and isolated prairie strip; (wet-mesic sand prairie)
High-quality natural community (unnamed site B)	Adjacent to EJ&E (north of tracks); adversely affected by recent road building; small and isolated prairie strip; (dry-mesic sand prairie)
High-quality natural community (St. John prairie site	Nearly 0.5 mile from EJ&E rail line; (wet-mesic sand prairie)
Hoosier Prairie Nature Preserve	No impacts expected to grassland and savanna wildlife; industry and petroleum storage area between EJ&E rail line and Hoosier Prairie; (wet sand prairie, wet-mesic sand prairie, mesic sand prairie, shrub swamp, dry sand savanna, dry sand prairie, marsh and dry-mesic sand prairie)
Oak Ridge Prairie County Park	Park boundary is nearly 0.5 mile from EJ&E rail line beyond private forest tract; (wet-mesic sand prairie)
Wadsworth Park	Small community park with a few remnant trees and unmowed natural area
Seberger Park	Park is adjacent to EJ&E rail line but appears to have significant on-site disturbance; (remnant dune and swale)
Black Oak Remnant Dune and Swale	Eastern edge of site is opposite an asphalt reprocessing yard; impacts from proposed project unlikely; (dry-mesic sand savanna/ marsh/shrub swamp)
Gibson Woods Nature Preserve	Natural dune and swale habitat; habitat and release site for the Karner blue butterfly, adjacent to EJ&E segment 2; adverse affects possible to mobile species, though plant community impacts are not expected; (mesic sand savanna and dry-mesic sand savanna)
Clarke and Pine Nature Preserve; High-quality natural community	Site is directly adjacent to EJ&E Segment 22, a rail line with no proposed increase in use under the Proposed Action; EJ&E Segment 1 with proposed increase in traffic is approximately 0.2 mile from site boundary; site has been cut off from adjacent natural areas by existing land uses; (marsh/dry-mesic sand prairie/dry sand prairie/dry sand savanna/wet-mesic sand prairie)
Pine Station Nature Preserve; High-quality natural community	Site is adjacent to EJ&E Segment 3 that has no proposed increase in use under the Proposed Action; EJ&E rail line with proposed increase in traffic is approximately 0.2 miles from site boundary; site cut off from adjacent natural areas by existing land uses; (dry-mesic sand prairie)
Jackson Park	Nearly 0.5 mile from EJ&E across major roadways and residential area
Indiana Dunes National Lakeshore	Area is separated from the EJ&E Dixie Lead by two rail lines, and is fragmented by additional rail and road crossings.

Locational Information and Survey Conditions
County: DuPage
Quadrangle: ~~Aurora South~~ West Chicago **Project Type/Title:** Phase I/Munger Station

Funding &/or Permitting Fed./State Agencies: Surface Transportation Board - Office of Economics, Environmental Analysis and Administration

Sec: 7 & 8 **T.:** 40 N **R.:** 9 E **Natural Divis. (no.):** 3a
Project Description: The client proposes to construct new rail lines within the project area.
Topography: The project area is located within the Wheaton Morainal physiographic province of Illinois. The Wheaton Morainal country is characterized by broad flat expanses (outwash plains) punctuated by the gently to steeply sloping moraines and till plains. Locally, the project area consists of gently undulating outwash plains.
Soils: Soils within the project area have been mapped as: Waupecan silt loam 2-4% slopes, Dunham silty clay loam 0-2% slopes, Muskego and Houghton Muck. Houghton series soils are very poorly drained soils on floodplains. These soils formed in herbaceous organic deposits and developed under a native vegetation of marsh grasses. Muskego series soils are very poorly drained soils situated on floodplains. These soils formed in a parent material of organic deposits and developed under a native vegetation of grasses, sedges, and reeds. Dunham series soils are situated on depressions on outwash plains. These soils formed in loess and the underlying outwash, and developed under a native vegetation of water tolerant grasses. Waupecan series soils are situated on outwash plains and stream terraces. These soils formed in a parent material of outwash, and developed under a native vegetation of prairie grass.
Drainage: The project area is drained by an unnamed drainage that drains into Brewster Creek, which in turn drains into the Fox River.
Land Use/Ground Cover (Include % Visibility): The majority of the project area is contained within grassland. A small portion of the project area is contained within a cornfield as well as a small area of wetland. Vegetation within the grassland portion of the project area was grass and weeds. Ground surface visibility in this area was 60%. Vegetation within the cornfield consisted of corn stubble. Ground surface visibility in this area was 80%. Vegetation within the wetland was reeds and water tolerant grasses. Wetland areas could not be surveyed due to standing water.
Survey Limitations: There were no limitations to a comprehensive survey of the project area.

SURFACE TRANSPORTATION BOARD

DECISION

STB Finance Docket No. 35087[1]

CANADIAN NATIONAL RAILWAY COMPANY AND GRAND TRUNK CORPORATION—CONTROL—EJ&E WEST COMPANY

Decision No. 11

Decided: June 11, 2008

On May 8, 2008, the Illinois Department of Transportation (IDOT) filed a motion to compel discovery from Canadian National Railway Company (CNR) and Grand Trunk Corporation (GTC), collectively referred to as applicants, seeking information on the cost of maintaining a segment of railroad track known as the St. Charles Airline in Chicago, IL. In accordance with 49 CFR 1104.13, applicants' reply to IDOT's motion was due by May 28, 2008. On May 28, 2008, the Board granted applicants a 14 day extension of time to reply to IDOT's motion so that applicants' reply would be due by June 11, 2008. On June 11, 2008, applicants requested an additional 14 day extension. Applicants state that IDOT consents to this request for an extension of time.

Applicants' request for additional time is reasonable and will be granted. Applicants' reply to IDOT's motion to compel will be due by June 25, 2008.

This action will not significantly affect either the quality of the human environment or the conservation of energy resources.

[1] This decision also embraces Elgin, Joliet and Eastern Railway Company—Corporate Family Exemption—EJ&E West Company, STB Finance Docket No. 35087 (Sub-No. 1); Chicago, Central & Pacific Railroad Company—Trackage Rights Exemption—EJ&E West Company, STB Finance Docket No. 35087 (Sub-No. 2); Grand Trunk Western Railroad Incorporated—Trackage Rights Exemption—EJ&E West Company, STB Finance Docket No. 35087 (Sub-No. 3); Illinois Central Railroad Company—Trackage Rights Exemption—EJ&E West Company, STB Finance Docket No. 35087 (Sub-No. 4); Wisconsin Central Ltd.—Trackage Rights Exemption—EJ&E West Company, STB Finance Docket No. 35087 (Sub-No. 5); EJ&E West Company—Trackage Rights Exemption—Chicago, Central & Pacific Railroad Company, STB Finance Docket No. 35087 (Sub-No. 6); and EJ&E West Company—Trackage Rights Exemption—Illinois Central Railroad Company, STB Finance Docket No. 35087 (Sub-No. 7).

It is ordered:

1. Applicants' request for an extension of time is granted.

2. Applicants' reply to IDOT's motion to compel is due by June 25, 2008.

3. This decision is effective on the service date.

By the Board, Anne K. Quinlan, Acting Secretary.

Anne K. Quinlan

SEC

SURFACE TRANSPORTATION BOARD

DECISION

STB Finance Docket No. 35087[1]

CANADIAN NATIONAL RAILWAY COMPANY AND GRAND TRUNK CORPORATION—CONTROL—EJ&E WEST COMPANY

Decision No. 12

Decided: June 25, 2008

On May 8, 2008, the Illinois Department of Transportation (IDOT) filed a motion to compel discovery from Canadian National Railway Company (CNR) and Grand Trunk Corporation (GTC), collectively referred to as applicants, seeking information on the cost of maintaining a segment of railroad track known as the St. Charles Airline in Chicago, IL. In accordance with 49 CFR 1104.13, applicants' reply to IDOT's motion was due by May 28, 2008. Extensions for time to reply to IDOT's motion were granted in decisions served on May 28, 2008 and June 11, 2008. The latest extension expires on June 25, 2008.

Applicants state that they are continuing to work with IDOT to resolve questions and concerns regarding the discovery request and have requested a 1-month extension to file their reply. However, applicants state that IDOT has not informed applicants as to whether it would consent to this extension. Accordingly, applicants request an initial 7-day extension to await a decision by IDOT as to whether it would consent to an extension and, if not, to allow sufficient time for applicants to prepare and file a response to the motion.

[1] This decision also embraces Elgin, Joliet and Eastern Railway Company—Corporate Family Exemption—EJ&E West Company, STB Finance Docket No. 35087 (Sub-No. 1); Chicago, Central & Pacific Railroad Company—Trackage Rights Exemption—EJ&E West Company, STB Finance Docket No. 35087 (Sub-No. 2); Grand Trunk Western Railroad Incorporated—Trackage Rights Exemption—EJ&E West Company, STB Finance Docket No. 35087 (Sub-No. 3); Illinois Central Railroad Company—Trackage Rights Exemption—EJ&E West Company, STB Finance Docket No. 35087 (Sub-No. 4); Wisconsin Central Ltd.—Trackage Rights Exemption—EJ&E West Company, STB Finance Docket No. 35087 (Sub-No. 5); EJ&E West Company—Trackage Rights Exemption—Chicago, Central & Pacific Railroad Company, STB Finance Docket No. 35087 (Sub-No. 6); and EJ&E West Company—Trackage Rights Exemption—Illinois Central Railroad Company, STB Finance Docket No. 35087 (Sub-No. 7).

Applicants' request for additional time is reasonable and will be granted. Applicants' reply to IDOT's motion to compel will be due by July 2, 2008. If, by July 2, 2008, applicants require more time to respond to IDOT's motion, the Board expects applicants to file a request for an extension with IDOT's consent.

This action will not significantly affect either the quality of the human environment or the conservation of energy resources.

It is ordered:

1. Applicants' request for an extension of time is granted.

2. Applicants' reply to IDOT's motion to compel is due by July 2, 2008.

3. This decision is effective on the service date.

By the Board, Anne K. Quinlan, Acting Secretary.

SURFACE TRANSPORTATION BOARD

DECISION

STB Finance Docket No. 35087

CANADIAN NATIONAL RAILWAY COMPANY AND GRAND TRUNK CORPORATION—CONTROL—EJ&E WEST COMPANY

Decision No. 13

Decided: July 24, 2008

In Decision No. 2, served November 26, 2007, the Board accepted for consideration the application filed by Canadian National Railway Company (CNR) and Grand Trunk Corporation (GTC) on October 30, 2007, for Board authorization of the proposed acquisition of control of EJ&E West Company (EJ&EW), a wholly owned noncarrier subsidiary of Elgin, Joliet & Eastern Railway Company (EJ&E), by CNR and GTC (collectively referred to as CN or applicants). The Board found the proposed transaction to be a "minor" transaction and the application to be in substantial compliance with the applicable regulations governing minor transactions. (This proposal is referred to as the transaction.) In this decision, the Board addresses applicants' request for time limits for the remaining environmental review and issuance of a final decision. As discussed below, the Board sets a schedule for completion of the environmental review process and issuance of a final decision, but does not adopt applicants' proposed schedule.

BACKGROUND

In Decision No. 2, the Board determined that preparation of an Environmental Impact Statement (EIS)[1] would be appropriate to fulfill the Board's obligations under the National Environmental Policy Act (NEPA), 42 U.S.C. 4321 et seq. The Board noted that issuance of a final decision on the merits of the application would not occur until the completion of the environmental review process by the Board's Section of Environmental Analysis (SEA) and recognized that this process might not be completed within the time limits set forth in 49 U.S.C. 11325(d)(2) for issuance of a final decision for a minor transaction (April 25, 2008). The Board indicated that no determination could be made regarding the time preparation of the EIS would take, but that, in the past, the EIS process has ranged from 18 months to several years.

[1] An EIS is the detailed written statement required by NEPA for major federal actions significantly affecting the quality of the human environment. See 49 CFR 1105.4(f).

On May 13, 2008, CN filed Applicants' Request for Establishment of Time Limits for NEPA Review and Final Decision, pursuant to the NEPA regulations of the President's Council on Environmental Quality (CEQ) at 40 CFR 1501.8. Claiming that failure to complete the transaction by December 31, 2008, could jeopardize the Stock Purchase Agreement (SPA) between CN and EJ&E (an indirect wholly owned subsidiary of United States Steel Corporation (USS)) and, ultimately, the transaction as a whole, applicants request that time limits be set by the Board. Applicants propose a schedule that they assert is fair and reasonable under the circumstances of the case, which contemplates the issuance of a final decision by December 1, 2008.

Numerous individuals and entities opposed CN's request. The opponents principally argue that applicants' proposed schedule is too short to allow SEA adequate time to complete the EIS process and provide for public involvement in this controversial case.[2] They note that the Board is not compelled by the CEQ regulations to adopt the schedule proposed by applicants (or any particular schedule).[3] In addition, they argue that the SPA does not make clear that December 31, 2008, is a "drop-dead" date because the SPA provides that the right to terminate the parties' agreement on December 31, 2008, does not apply if the Board proceeding remains pending. Certain other parties complain that CN's efforts to mitigate the environmental impacts of the transaction have been inadequate.

Various parties filed statements in support of CN's request. For example, Union Pacific Railroad Company (UP) urges that the environmental review be completed as expeditiously as possible and raises concerns that an extended environmental review in this matter could deter future railroad transactions intended to increase rail capacity and efficiency.[4] Similarly, a number of short line railroads express concern that delaying this transaction for an indefinite time to conduct an environmental review would set a bad precedent for other railroad transactions, noting that the Board's generally expeditious regulatory processes have helped

[4] See UP Reply at 2-3.

bring about a successful short line industry.[5] Several other parties have submitted letters and comments in support of CN's request.

The United States Department of Transportation (DOT) states that it does not support any particular schedule, but favors the adoption of a reasonably expedited schedule for completion of this proceeding. DOT notes that a reasonable schedule can be established without harm to NEPA or the Interstate Commerce Act, given the progress made to date in this proceeding, the availability of adequate resources, and the Board's familiarity with the types of issues that have been raised.

On May 28, 2008, EJ&E and EJ&EW (collectively EJ&E) filed a reply to CN's request to clarify the record with regard to the SPA. EJ&E states that its position, and that of its parent company, USS, with regard to termination of the SPA is that the parties to the SPA have the "unconditional and unilateral right to terminate the agreement if the closing does not occur on or before December 31, 2008."[6]

DISCUSSION AND CONCLUSIONS

CN argues that the Board is required by 40 CFR 1501.8 to set time limits here and that the Board should adopt applicants' proposed schedule. For the reasons discussed below, the Board will set a reasonable schedule for the remainder of the environmental review process and the issuance of a final decision, but will not adopt applicants' proposed schedule.

1. The Applicable CEQ Regulations.

The CEQ regulations specifically state that while "prescribed universal time limits for the entire NEPA process are too inflexible," federal agencies should set time limits for a proposed action if an applicant for the proposed action requests them, provided that "the time limits are consistent with the purposes of NEPA and other essential considerations of national policy."[7] The CEQ regulations do not require that an agency adopt the time limits proposed by an applicant. Instead, the regulations set forth eight factors for agencies to consider when determining appropriate time limits, including: "[p]otential for environmental harm"; "[s]ize of the proposed action"; "[s]tate of the art of analytical techniques"; "[d]egree of public need for the potential action, including consequences of delay"; "[n]umber of persons and agencies affected"; "[d]egree to which relevant information is known and if not known the time required for

obtaining it"; "[d]egree to which the action is controversial"; and "[o]ther time limits imposed on the agency by law, regulations, or executive order."[8]

2. Determination of What Time Limits are Appropriate Here.

Applicants request that the Board adopt the following schedule for the remaining environmental review and final decision of the Board:

- Draft EIS served — July 15, 2008
- Draft EIS comments due — September 2, 2008
- Final EIS served — November 3, 2008
- Final Decision served — December 1, 2008[9]

In support of their proposed schedule, applicants argue that several alleged public interest benefits of the proposed acquisition are at risk due to the uncertainty regarding completion of the NEPA review and final decision by the Board. They claim that their proposed schedule is reasonable because there have been few objections to the transaction on competitive grounds; the Board found the proposed transaction to be a "minor transaction;" and the public benefits of the transaction, if approved, would be many, including: "insur[ing] a more efficient and reliable rail transportation system at a lower cost; over time, reduc[tion in] rail congestion and increase[d] rail capacity in Chicago's urban core; and increase[d] flexibility for CN operations, positively benefiting its current and future shippers."[10] Applicants note that the reduction in rail congestion would help to keep freight from shifting to trucks, which is environmentally beneficial. In terms of benefits to communities, applicants state that shifting movements from Chicago's core to the EJ&E arc would increase efficiency and decrease the overall environmental effects of CN's service on the Chicago region.

Central to applicants' argument that their proposed schedule should be adopted is their claim that section 2.3 of the SPA[11] contains a "drop-dead" date of December 31, 2008, after

---

[8] 40 CFR 1501.8(b)(1).

[9] See CN-33 at 5.

[10] CN-33 at 10, 15.

[11] Section 2.3 of the SPA states, in part:

> 2.3 Closing. The purchase and sale referred to in Section 2.1 and the deliveries and transactions referred to in Section 2.4 (the "**Closing**") shall take place at 10:00 A.M. (Chicago time) . . . as soon as practicable after the last of the conditions set forth in Articles VI and VII . . . is satisfied or waived, but in no event later than the second (2nd) Business Day thereafter or at such other time and date as the parties hereto shall agree, but not later than September 1, 2008, unless Closing shall have failed to occur for one or more of the reasons set forth in Section 9.1(b)(ii) of this Agreement, in which case Closing may be extended to no later than

(continued . . .)

which either party may terminate the SPA. While recognizing that the SPA also allows for amendment by mutual consent,[12] applicants argue that there is no reason to expect that USS, the parent company of EJ&E, would agree to an extension without a reliable completion date for the regulatory process. Indeed, EJ&E's reply, filed May 28, 2008, states that it is the "position of EJ&E and USS from the time that the provisions of the SPA were negotiated and finalized and continuing up to the present time that both EJ&E and GTC have the unconditional and unilateral right to terminate the agreement if the closing does not occur on or before December 31, 2008."[13] Applicants therefore request that the regulatory process be completed by December 1, 2008, so as to allow for finalization of the transaction prior to December 31, 2008, if the proposed acquisition is approved.

Barrington and others,[14] however, have pointed out that applicants' statements with regard to the "drop-dead" date of December 31, 2008, do not make clear that USS will have the right to unilaterally terminate the SPA if the closing cannot occur by December 31, 2008, due to the need to complete the Board's NEPA review. Article IX, "Termination and Abandonment," of the SPA, which is referred to in section 2.3, specifically states, in part:

> § 9.1 Termination. This Agreement may be terminated and the transactions contemplated hereby may be abandoned, at any time prior to the Closing:
> . . .
> (b) by any Party if the Closing shall not have occurred by December 31, 2008; provided that the right to terminate this Agreement under this Section 9.1(b) shall not be available . . . (ii) if the reason for failure of the Closing to occur on or before such date is one or more of the following: (A) the STB has not issued a final decision in the Exemption Proceeding or the Control Proceeding; . . . (C) the STB has not completed such review of the transactions contemplated by this Agreement as may be required under [NEPA] or the National Historic Preservation Act, 16 U.S.C. 470, in connection with the Exemption Proceeding and the Control Proceeding. . . .[15]

(. . . continued)

> December 31, 2008, after which date this Agreement may terminate at the option of either party. Such date is herein referred to as the "**Closing Date**" (emphasis in original).

[15] CN-2 at 293.

As noted by several parties,[16] this section, on its face, seems to conflict with section 2.3 of the SPA and appears to indicate that the parties to the SPA planned for the possibility that the transaction could require an environmental review process that extended beyond December 31, 2008. In these circumstances, the "consequences of delay" under 40 CFR 1506.8(b)(1)(iv) here do not warrant adoption of applicants' proposed procedural schedule for this controversial case, which involves an unprecedented amount of public participation during the EIS process and a large number of potential environmental issues that need time to be adequately assessed.[17]

Applicants note that in reviewing agency compliance with NEPA, the courts have taken into account whether an agency's governing statute imposes short, mandatory deadlines on the agency.[18] Section 11325(d), the statutory provision at issue here, does set time deadlines for minor transactions but allows for discretion on the part of the Board, where appropriate, and does not contain predetermined outcomes if the deadlines in section 11325(d) are not met.[19] Indeed, the U.S. Court of Appeals for the D.C. Circuit, in rejecting the argument that section 11325 requires the Board to adhere to a strict timetable, stated that "forcing the Board to proceed pursuant to [section] 11325 before it has had an opportunity to determine where the public interest lies would defeat altogether the purpose of the agency's review."[20] The same is true with NEPA, which requires agencies to take a "hard look" at the potential environmental issues, disclose the potential environmental impacts, and allow for public input so that the Board can weigh both environmental issues and issues on the transportation merits in deciding whether to approve a proposed transaction, deny it, or approve it with conditions, including environmental conditions.[21] The fact that the proposed transaction has been classified as "minor" does not control the determination regarding the time necessary to complete the environmental review.

The CEQ regulations at 40 CFR 1501.8(b)(1)(vii) provide that, in setting time limits, agencies consider, as one of the factors, the "time limits imposed on the agency by law, regulations, or executive order." Here, the time limits in 49 U.S.C. 11325(d) support the conclusion that the Board should complete this proceeding in an expeditious manner, but do not require adoption of applicants' suggested schedule. Nothing in NEPA, the case law, or the CEQ regulations require the Board to set a specific date with regard to service of the Final EIS and it would not be appropriate to do so here since the Board cannot predict in advance the extent or types of comments that might be made on the Draft EIS. The schedule that the Board is adopting sets reasonable time limits that accommodate NEPA and Congress' intent in section 11325(d) that the Board complete this proceeding expeditiously.

---

[16] See BARR-4 at 14; WILL-10 at 6-7; Letter from Village of Wayne (June 2, 2008).

[17] See 40 CFR 1501.8(b)(1)(v), (vii).

[18] See CN-33 at 6, 15.

[19] See Gottlieb v. Pena, 41 F.3d 730, 733 (D.C. Cir. 1994).

[20] Western Coal Traffic League v. Surface Transportation Board, 216 F.3d 1168, at 1172, 1175 (D.C. 2000).

[21] See 40 CFR 1501.8(a).

The Board's schedule, which is set out fully below, projects completion of the Final EIS between December 1, 2008, and January 31, 2009, with issuance of a final decision subject to the time periods in the CEQ regulations at 40 CFR 1506.10(b)(2). With this schedule, the Board plans to complete the EIS process in less time than the time NEPA review has taken in other cases with similar issues.[22] The goals of both NEPA and sections 11324-25 will be met under the timeline the Board is setting because the proceeding should be concluded in a reasonably expeditious manner without jeopardizing the ability to conduct a thorough and complete environmental review process. As always, the Board reserves the right to adjust this schedule as facts and circumstances require or if the Board determines that adherence to this schedule would hinder its ability to fulfill its obligations under NEPA.

Finally, several parties have addressed the appropriate length of comment period on the Draft EIS, which is being issued today. The CEQ regulations require a minimum of 45 days for public review and comment in a Draft EIS, which is the time period suggested by applicants in their proposed schedule. Barrington and a number of others have requested a 120-day comment period (or longer) to file comments on the Draft EIS. On June 10, 2008, applicants opposed those requests.

The parties have not shown that the delay that would be caused by a 120-day comment period would be warranted here. On the other hand, the minimum 45-day time limit set forth in the CEQ regulations might not allow for careful review and comment on all of the analysis in the multi-volume Draft EIS. Thus, the Draft EIS provides for a 60-day comment period. That period is appropriate for this transaction; it should provide adequate time for interested parties, agencies, government entities, and members of the general public to analyze and comment on all aspects of the Draft EIS, while allowing for a reasonably expeditious completion of this proceeding.

3. The Board's Schedule.

Having considered the extensive record that is before the Board on this matter, the NEPA regulations, and other relevant legal authority governing the transaction, the Board finds that the following schedule is appropriate under the circumstances. As noted, the Board reserves the right to adjust this schedule as necessary.

[22] Applicants note that the Conrail merger, one of the most complicated merger transactions to come before the Board, only took 11 months from the date of the filing of the application to serve the Final EIS. But the environmental review process in Conrail actually took at least 18 months because substantial environmental work was ongoing by SEA (and, separately, by the applicants) beginning in early 1997, some six months before the application was filed.

Draft EIS served	July 25, 2008
Publication of Notice of Availability of Draft EIS in the Federal Register by the United States Environmental Protection Agency (EPA)	August 1, 2008
SEA Public Meetings on Draft EIS	Weeks of August 25, 2008 and September 8, 2008
Draft EIS comments due	September 30, 2008 (60 days after publication of EPA's Notice of Availability)
Final EIS served	Projected between December 1, 2008, and January 31, 2009
Final decision served	As soon as possible, pursuant to the CEQ regulations at 40 CFR 1506.10(b)(2)

This decision will not significantly affect either the quality of the human environment or the conservation of energy resources.

It is ordered:

1. Applicants' request for the establishment of time limits for the remaining NEPA review and issuance of the final decision is granted, but the schedule requested by applicants is not adopted.

2. The Board adopts the schedule set forth above and denies all other requests for alternative schedules.

3. This decision is effective on its service date.

By the Board, Chairman Nottingham, Vice Chairman Mulvey, and Commissioner Buttrey. Commissioner Buttrey commented with a separate expression.

Anne K. Quinlan
Acting Secretary

COMMISSIONER BUTTREY, concurring:

I join in the Board's decision today setting a schedule for completion of the environmental review process and issuance of a final decision in this matter. However, I have asked that this separate expression be included in order to express my deep concern with certain issues raised on the record that has been developed to date in this proceeding. I do so in the hope that the applicants and other interested parties will address these issues squarely in the remaining months before the Board must decide whether to approve the proposed transaction.

The statute requires that the Board must determine whether the proposed transaction is consistent with the public interest. Further, for a transaction like this that does not involve the merger or control of at least two Class I railroads, the statute provides that the Board shall approve the application unless it finds serious anticompetitive effects that outweigh the public interest.

Rail congestion has been a long-standing challenge in the greater Chicago area. Many well intentioned efforts have been made to address this problem over the years, but without total success. The application in this proceeding appears to be yet another such effort. It may indeed be motivated largely by frustration with the lack of success in dealing with Chicago rail congestion in the past. But this proceeding is different from other comprehensive efforts in that it would benefit mostly one rail carrier and its commercial partners.

For this proposed transaction, the scope, in terms of track mileage and transaction cost, is relatively low. However, the issues related to environmental impacts, mitigation costs, and impacts on the affected communities both now and in the future appear to be incredibly high. The local Chicago communities directly impacted by this transaction, particularly, in my view, those located along EJ&E's line north of Joliet, are essentially being asked to bear the heavy burden of years of failed efforts to address the Chicago rail congestion problem in a more comprehensive manner. There could also be a chilling effect on the future development of commuter rail service in the communities west of Chicago, which appears to me to be antithetical to the broadly defined public interest.

The Board must be very sensitive to the environmental issues being raised by local communities, and I am confident that these concerns will be fully explored and considered in the EIS being prepared on the schedule we adopt today. I urge all interested parties to participate actively in this process. At the end of the environmental review process, I will carefully consider the recommended mitigation conditions that are generated, and they will factor importantly in my decision-making process. However, based on what I see now on the record, and what I saw when I recently visited the affected communities, it is hard for me to imagine how even the most far-reaching mitigation measures would be enough to offset or balance the environmental detriments that would flow from this proposal.

39357 SERVICE DATE – LATE RELEASE SEPTEMBER 8, 2008
EB

SURFACE TRANSPORTATION BOARD

DECISION

STB Finance Docket No. 35087

CANADIAN NATIONAL RAILWAY COMPANY AND GRAND TRUNK CORPORATION—CONTROL—EJ&E WEST COMPANY

Decision No. 14

Decided: September 8, 2008

In this proceeding, Canadian National Railway Company (CNR) and Grand Trunk Corporation (GTC) (collectively referred to as CN or applicants) seek Board authorization to acquire control of EJ&E West Company (EJ&EW), a wholly owned noncarrier subsidiary of Elgin, Joliet & Eastern Railway Company (EJ&E). Under the terms of the stock purchase agreement dated September 25, 2007 (SPA),[1] the EJ&E would transfer a substantial portion of its existing rail line, consisting primarily of an arc around Chicago, IL, to EJ&EW, and then sell its EJ&EW stock to GTC.[2]

In Decision No. 2, served November 26, 2007, the Board accepted the application for consideration under 49 CFR 1180.2(c), and also concluded that an Environmental Impact Statement (EIS)[3] would need to be prepared to fulfill the Board's obligations under the National Environmental Policy Act (NEPA), 42 U.S.C. 4321 et seq. The Board explained that it would not issue a final decision on the application until the EIS process is completed, which has taken from 18 months to several years to complete in other cases.

On May 13, 2008, CN asked the Board to complete the NEPA review and serve a final decision approving the application by December 1, 2008, so that GTC and EJ&E could complete the stock purchase by December 31, 2008. In Decision No. 13, served July 25, 2008, the Board set December 1, 2008, to January 31, 2009, as a target for the issuance of the Final EIS, followed by a final decision on the application as soon as possible thereafter.

On August 14, 2008, CN filed a further petition to modify the procedural schedule. CN now asks the Board to rule that applicants have met the criteria of 49 U.S.C. 11324(d)(1) for

---

[1] Railroad Control Application, CN-2, Exhibit 2.

[2] The details are summarized at CN-2, pp. 19-20.

[3] An EIS is the detailed written statement required by NEPA for major federal actions significantly affecting the quality of the human environment. See 49 CFR 1105.4(f).

approval of an acquisition that does not involve more than one Class I railroad and to allow CN to take control of EJ&E before issuance of the Final EIS and subsequent Board consideration of the potential environmental impacts. CN proposes that the Board condition its approval of the acquisition on CN maintaining the environmental *status quo* until the decision on the deferred environmental issues and on CN acknowledging that the Board retains "all legal authority the Board currently possesses to impose environmental conditions in this proceeding." CN requests that the Board serve a final decision by October 15, 2008, effective November 14, 2008, that would allow CN and EJ&E to complete the stock purchase by December 31, 2008. CN reiterates its previous assertion that there is a substantial risk the SPA will be terminated if not closed by December 31, 2008. CN argues that bifurcating the proceeding in the manner sought here—allowing CN to take control of EJ&EW subject to the requirement that it preserve the environmental *status quo* until completion of the environmental review—is consistent with NEPA.[4] Several parties have filed replies in opposition.[5]

DISCUSSION AND CONCLUSIONS

CN has styled its request as a petition for relief not otherwise provided for in the Board's rules pursuant to 49 CFR 1117.1. However, the essence of CN's petition is that the Board should reopen the determination in Decision No.2 that a decision on the merits of the application would not be issued until after completing the environmental review. Under 49 U.S.C. 722(c) and 49 CFR 1115.4, a petition to reopen requires a showing of material error, new evidence, or substantially changed circumstances in order to obtain relief. CN has not satisfied any of these criteria.

We note also that CN's petition appears to assume that, while the Board could impose environmental mitigation conditions on its approval of the application, the Board either could not or would not deny the application in this case on environmental grounds. In their reply, American Chemical Services et al. assert not only that denial is possible, but that there is "much more than a mere possibility" that this application would be denied due to adverse environmental impacts. We need not reach those issues here.

---

[4] In its petition, CN also reiterates its prior argument that 49 U.S.C. 11325(d) requires the Board to issue a final decision on its application within 180 days. In Decision No. 13 (slip op. at 6), we explained that the Board has discretion in appropriate circumstances to take more than 180 days to complete the record and render a decision in an application for approval of a change in control under 49 U.S.C. 11324(d).

[5] Joint Letter from Hon. Peter J. Visclosky, Member of Congress, et al. (Aug. 22, 2008); Reply in Opposition of American Chemical Service, Inc., Aux Sable Liquid Products, LP, and Equistar Chemicals, LP (filed Aug. 27, 2008); Village of Barrington Reply (filed Sept. 3, 2008); Village of Frankfort's Opposition (filed Sept. 3, 2008). Letters in support of CN's petition have also been filed by American Suzuki Motor Corporation, Canfor Wood Products Marketing Ltd., Chicago Heights Steel, Consolidated Grain and Barge Co., Hanjin Shipping Company, Ltd., Millar Western Forest Products Ltd., the National Industrial Transportation League, Patrick Engineering Inc., Solutions To Area Rail Traffic, SSAB North American Division, Verso Paper Corp., and Viterra.

As discussed below, we will deny CN's petition because (i) a procedure that gives CN control over EJ&EW before the Board rules on the environmental issues violates NEPA principles and regulations; and (ii) CN has failed to demonstrate that its proposal would be workable and would maintain the environmental *status quo*.

Proposed "Bifurcation"

The crux of CN's petition is that the Board can reconcile its responsibilities under the Interstate Commerce Act and its NEPA responsibilities by treating approval of the stock purchase as a separate Federal action for NEPA purposes from a subsequent determination of the decision concerning the environmental mitigation conditions to be attached to approval of CN's application. CN argues that approval of the stock purchase would not have any environmental effects in light of its willingness to maintain the environmental *status quo* while the Board completes the environmental review. CN also maintains that approving the stock purchase would not diminish the Board's conditioning authority since CN would be willing to accept any environmental mitigation conditions subsequently imposed in the environmental phase (subject to its right to challenge in court any conditions that it considers unreasonable). CN-49 at 12-13.

We do not believe that it would be consistent with NEPA or agency precedent to consider the proposed stock purchase separately from our environmental review. The regulations of the Council on Environmental Quality (CEQ) (the Federal agency responsible for establishing the implementing rules for Federal agency compliance with NEPA) provide that: "Proposals or parts of proposals which are related to each other closely enough to be, in effect, a single course of action shall be evaluated in a single impact statement." 40 CFR 1502.4(a). Indeed, CN itself has previously recognized in this case that NEPA requires the completion of the EIS before the Board issues its final decision on whether to approve the change in control.[6]

Nor do we believe that agency precedent supports treating approval of CN's acquisition of the EJ&EW and approval of CN's proposed Operating Plan as separate Federal actions. Since enactment of NEPA, neither the Board nor its predecessor, the Interstate Commerce Commission (ICC), has ever issued a final decision approving a merger or acquisition prior to the issuance of a Final EIS or an Environmental Assessment (EA) where such an environmental document, as defined by the CEQ at 40 CFR 1508.10, was required.

In fact, the cases cited by CN demonstrate why it would not be consistent with NEPA or the CEQ regulations to treat approval of the stock purchase as separate from CN's operating plan. In Union Pacific/Southern Pacific Merger, 1 S.T.B. 233 (1996), aff'd sub nom. Western Coal Traffic League v. STB, 169 F.3d 775 (D.C. Cir. 1996) (UP/SP), a comprehensive EA and Post Environmental Assessment (Post EA) were issued prior to the Board's final decision approving that merger with conditions. In its final decision, the Board imposed comprehensive systemwide and corridor-specific environmental conditions, as well as local environmental mitigation, and concluded that an EIS was unnecessary because, with those mitigation

[6] Applicants' Comments on the Draft Scope of Study at 9 (filed February 15, 2008) ("the Board cannot authorize the Transaction on the merits until the EIS is complete").

conditions, the merger would not have significant environmental impacts. Although the Post EA found that more focused mitigation studies were warranted to develop appropriate mitigation for Reno, NV, and Wichita, KS, "[n]othing in the record suggest[ed] that the potential environmental effects of the merger in Reno or Wichita are so severe that implementation of the merger should not proceed prior to the completion of the studies." 1 S.T.B. at 515. Thus, the Board imposed conditions to preserve the environmental *status quo* in Reno and Wichita pending the development of the additional mitigation for those cities. Here, in contrast, CN is asking the Board to act before the Board has issued a Final EIS for any part of the line and before any mitigation measures have been finally determined for any part of the line.

Neither of the other two cases cited by CN—Iowa, Chicago & Eastern Railroad Corporation—Acquisition and Operation Exemption—Lines of I&M Rail Link, LLC, STB Finance Docket No. 34177 (STB served July 22, 2002) (ICE/I&M), nor Canadian Pacific Railway—Control—Dakota, Minnesota & Eastern Railroad, STB Finance Docket No. 35081 (STB served Apr. 4, 2008) (CP/DME)—supports CN's position. Both of those cases involved the Dakota, Minnesota & Eastern Railroad (DM&E) and threshold determinations by the Board that the environmental impact from the possible future construction by DM&E of a new rail line to transport coal from the Powder River Basin (PRB) in Wyoming was too speculative and uncertain to be studied in connection with the proposed carrier acquisitions by or of DM&E.[7] In both cases, the Board found that the operating changes resulting solely from the acquisition of the other carrier were modest and did not warrant the preparation of an EIS or EA. In both cases, DM&E had not yet decided to actually build the line into the PRB, so there was no time table for construction of the line, and the information needed to prepare an EIS or EA related to new traffic from the PRB—such as likely shippers, routings for PRB coal, destinations and frequencies—did not exist. Therefore, it was reasonable in both cases for the Board to defer consideration of the impact of moving PRB coal over the newly combined lines until the construction of the new line became probable and to attach a condition to preserve the environmental *status quo* in the meantime with respect to the movement of PRB coal.

Here, by contrast, there is nothing speculative or remote about the traffic increases that are projected with this transaction. CN has provided detailed information on the frequencies and the routings of the increased EJ&EW traffic. Moreover, CN seeks to take control of EJ&E for the very purpose of integrating the EJ&E into CN's system and rerouting significant amounts of rail traffic over the EJ&E's lines. Approval of the application is a condition precedent to implementation of CN's Operating Plan. They are two links in the same chain that must be studied together under 40 CFR 1502.4.

Finally, the agency's former policy of conditionally approving proposals for the construction of a new or extended rail line before completion of the environmental review process does not support CN here because no authority was granted in those cases until the

[7] Also, in CP/DME, slip op. at 10-11, the Board specifically found that Canadian Pacific Railway's acquisition of DM&E was too remote from the potential future transportation of coal over the lines of Canadian Pacific or the ICE to be considered a single course of action under 40 CFR 1502.4(a) for NEPA review purposes.

Board subsequently issued a decision on the environmental issues. Here, in contrast, CN seeks more than a declaration from the Board that the transaction would not substantially lessen competition, create a monopoly, or restrain trade in freight surface transportation in any region of the United States. Rather, CN seeks authorization to acquire EJ&EW. Moreover, the Board's current practice in cases involving proposals for the construction of a new rail line is to consider the environmental aspects of a proposed action at the same time as it considers the transportation or other public interest aspects. See Alaska Railroad Corporation—Construction and Operation Exemption—Rail Line Between Eielson Air Force Base (North Pole) and Fort Greely (Delta Junction), AK, STB Finance Docket No. 34658, slip op. at 2 (STB served Oct. 4, 2007).

CN's Proposed Environmental Condition

In any event, we are not persuaded that the proposal outlined by CN in its petition would be sufficient to preserve the environmental *status quo* in the interim period between the requested approval of the transaction under section 11324(d) and the completion of the Board's environmental review. CN represents that, if allowed to take control of EJ&EW, it would not "undertak[e] Transaction-related actions (such as the re-routing of trains from intra-Chicago routes to the EJ&EW) that could cause adverse environmental impacts" prior to the completion of the environmental phase of the proceeding. Petition at 2, n.2. However, CN expressly excludes certain categories of actions from this voluntary forbearance, such as the service of new traffic tendered by shippers or the interchange of new trains with carriers not under the control of CN. Id. This exception could result in significant increases in traffic along the lines that would not have occurred but for the transaction.[8] Armed with a favorable "October Merits Decision," CN could solicit significant additional traffic from non-CN origination points, and increased traffic could begin to flow prior to completion of the NEPA review and the Board's consideration of appropriate conditions.

CN's proposal would be difficult to monitor and enforce. CN essentially asks us to trust that it would maintain the environmental *status quo*, as CN interprets it, and that it would bring to the Board in advance any close questions on whether a particular action would properly be considered within the *status quo*. To assure maintenance of the environmental *status quo*, there would need to be objective standards by which compliance could be monitored. Presumably, such maintenance would need to include establishing quantifiable traffic limits, retaining the services of an independent monitor to report traffic levels to the Board, and enforcing traffic restrictions with remedies significant enough to deter violations (including possible divestiture of the EJ&EW assets or suspension of operating authority). Such a monitoring regime, however, would unduly involve the Board in the day-to-day details of EJ&EW's operations and could well result in frequent complaints by communities along EJ&EW's lines that CN was increasing traffic beyond the *status quo*. CN has offered no feasible suggestions for independent monitoring or effective enforcement of the *status quo*.

[8] Although it is true that EJ&E could, prior to the sale and on its own initiative, decide to increase traffic on its line to any level it deems appropriate without the need for Board approval, the record does not suggest that it has done so in the recent past or has any present intention to do so.

This case is unlike the other cases cited by CN in terms of the difficulty in establishing objective traffic standards and monitoring compliance. In both CP/DME and ICE/IM, where the new DM&E line into the PRB has not yet been constructed, the Board precluded the carriage of any coal traffic over Canadian Pacific or IC&E lines that originated on DM&E's proposed line into the PRB until the environmental review process for the impacts of the traffic flows is complete. Similarly, in UP/SP, the Board permitted the merged carrier to add only an average of two trains per day on the affected rail line segments to preserve the environmental *status quo* in Reno and Wichita pending the completion of supplemental studies to produce specifically tailored mitigation plans to ensure that localized environmental issues were addressed. 1 S.T.B. at 517. Moreover, the Board had already imposed significant systemwide environmental conditions and was satisfied that "with the systemwide and corridor-specific mitigation already imposed and the conditions to be arrived at following the independent mitigation studies, there would be no significant environmental impacts to Reno and Wichita . . . ." 1 S.T.B. at 516. In sum, the limitations on the carriers' operations were clear in those cases, and monitoring was simple. Here, in contrast, CN seeks to be allowed to control EJ&EW's traffic flows prior to the imposition of any environmental conditions whatsoever, save for CN's undefined pledge to maintain the *status quo* and to monitor itself.

This decision will not significantly affect either the quality of the human environment or the conservation of energy resources.

It is ordered:

1. Applicants' petition is denied.

2. This decision is effective on its service date.

By the Board, Chairman Nottingham, Vice Chairman Mulvey, and Commissioner Buttrey.

Anne K. Quinlan

SURFACE TRANSPORTATION BOARD

DECISION

STB Finance Docket No. 35087[1]

CANADIAN NATIONAL RAILWAY COMPANY AND GRAND TRUNK CORPORATION—CONTROL—EJ&E WEST COMPANY

Decision No. 15

Decided: September 10, 2008

In Decision No. 2, served November 26, 2007, the Board accepted for consideration the application filed by Canadian National Railway Company (CNR) and Grand Trunk Corporation (GTC) on October 30, 2007 (October 30 application), for Board authorization of the proposed acquisition of control of EJ&E West Company (EJ&EW), a wholly owned noncarrier subsidiary of Elgin, Joliet & Eastern Railway Company (EJ&E), by CNR and GTC (collectively referred to as CN or applicants). This proposal is referred to as the transaction.

BACKGROUND

In its October 30 application, CN stated that, as part of the proposed transaction, it expects to cease operations over an 11-mile segment of railroad track known as the St. Charles Air Line route (Air Line route) in Chicago, IL, by the end of the 3-year implementation period of the transaction. Several parties, including the National Railroad Passenger Corporation (Amtrak), filed comments, expressing opposition to the proposed transaction and asserting that the abandonment of the Air Line route would result in the disruption or discontinuance of Amtrak service to affected locations. In response to these comments, CN states that it has agreed to the conditions sought by Amtrak, namely that Amtrak may remain on the Air Line route, until

[1] This decision also embraces Elgin, Joliet and Eastern Railway Company—Corporate Family Exemption—EJ&E West Company, STB Finance Docket No. 35087 (Sub-No. 1); Chicago, Central & Pacific Railroad Company—Trackage Rights Exemption—EJ&E West Company, STB Finance Docket No. 35087 (Sub-No. 2); Grand Trunk Western Railroad Incorporated—Trackage Rights Exemption—EJ&E West Company, STB Finance Docket No. 35087 (Sub-No. 3); Illinois Central Railroad Company—Trackage Rights Exemption—EJ&E West Company, STB Finance Docket No. 35087 (Sub-No. 4); Wisconsin Central Ltd.—Trackage Rights Exemption—EJ&E West Company, STB Finance Docket No. 35087 (Sub-No. 5); EJ&E West Company—Trackage Rights Exemption—Chicago, Central & Pacific Railroad Company, STB Finance Docket No. 35087 (Sub-No. 6); and EJ&E West Company—Trackage Rights Exemption—Illinois Central Railroad Company, STB Finance Docket No. 35087 (Sub-No. 7).

the Grand Crossing Connection or another acceptable alternative is available, at a cost to be capped at the current level (adjusting only for inflation pursuant to the formula contained in the agreement between CN and Amtrak) and at the level of operating utility currently enjoyed by Amtrak.

On May 8, 2008, the Illinois Department of Transportation (IDOT) filed a motion to compel discovery from CN, seeking information regarding the cost of maintaining tracks, equipment, bridges, viaducts, and grade crossings along the Air Line route.[2] IDOT asserts, among other things, that obtaining information detailing the cost of maintaining the tracks and structures is critical to the public interest because the cost of maintaining the Air Line route will be borne by IDOT and Amtrak, ultimately at the public expense, under the terms of the proposed transaction. IDOT notes that, while CN has informed IDOT of CN's ongoing negotiations with Amtrak, no binding agreement regarding maintenance of the Air Line route has been reached, nor has CN provided IDOT with any meaningful assurances to that effect.

In a reply filed July 2, 2008, CN reiterates its commitment to negotiating with Amtrak an agreement that would implement the commitments sought by Amtrak. CN states that its offer to allow Amtrak to maintain existing service at no additional cost resolves any and all issues, including IDOT's concerns, regarding the impacts of the proposed transaction on Amtrak service. CN also notes that it has invited the Board to impose the commitments made to Amtrak as conditions to authorization of the transaction. Further, CN states that the information sought by IDOT is not developed or maintained by CN in the regular course of business. In a letter to IDOT, dated February 7, 2008, CN states that it "does not have and does not regularly develop actual or projected maintenance costs" for the Air Line route and that the current CN/Amtrak agreement, which runs through January 31, 2010, provides for Amtrak to pay a fixed base rate for maintenance, subject to escalation in accordance with indices. CN further states in the February 7 letter that it has agreed to develop this information as part of its confidential negotiations with Amtrak.

DISCUSSION AND CONCLUSIONS

IDOT's motion to compel will be denied. CN submits that the information is not maintained and does not exist. In light of this representation, an order to compel the production of this information would serve no purpose.[3] A party can not be required to prepare new documents solely for their production. Also, given CN's representations regarding the Air Line route, namely its commitment, as a condition of the Board's approval of the application, to capping costs at current inflation-adjusted levels for as long as Amtrak remains on the Air Line route, the information sought by IDOT is not likely to be relevant for the purposes of this proceeding. CN has consistently represented its commitment to Amtrak throughout its filings

[2] Specifically, IDOT submitted five document requests, including "any analysis or projections regarding the annual maintenance and operation activities and costs required or recommended for the CN track after the acquisition is fully implemented." IDOT Request for Production of Documents (filed March 3, 2008).

[3] The Board's discovery rules require the existence of documents sought. See 49 CFR 1114.30.

before the Board. In its March 13 reply, CN states that it has agreed to the conditions sought by Amtrak and included a letter to Amtrak, dated March 10, 2008, in which it expresses its commitment to allowing Amtrak to remain on the Air Line route and to capping costs to Amtrak for maintaining the segment at the current level, indexed for inflation in future years, as provided by the current CN/Amtrak agreement. In a March 27, 2008 filing, CN reiterates this commitment in response to a letter of opposition filed by Congresswoman Melissa Bean. The Draft EIS, served July 25, 2008, also includes this commitment as a voluntary mitigation measure submitted by CN. Though no binding agreement has been reached between CN and Amtrak, it appears that, should the transaction be approved, CN is fully intent on allowing Amtrak to remain on the Air Line route, until an alternative route is available, at costs capped at the current level (as adjusted for inflation). CN, in its surrebuttal, filed April 28, 2008, states that it does not object to the Board conditioning approval of the transaction on its commitment to Amtrak. A condition along those lines, if imposed by the Board, could adequately address IDOT's concerns regarding any costs it might incur under the proposed transaction.

To the extent that IDOT has concerns regarding matters that are covered by the environmental review of the proposed transaction, it may submit comments before the Board's Section of Environmental Analysis (SEA).[4]

This action will not significantly affect either the quality of the human environment or the conservation of energy resources.

It is ordered:

1. IDOT's motion to compel is denied.

2. This decision is effective on the service date.

By the Board, Anne K. Quinlan, Acting Secretary.

Acting Secretary

[4] See Canadian National Railway Company and Grand Trunk Corporation—Control—EJ&E West Company, STB Finance Docket No. 35087 (STB served Feb. 22, 2008) (Decision No. 8). In Decision No. 8, the Board denied motions to compel filed by parties seeking discovery on environmental matters. The Board found that formal discovery on environmental issues was not available because such information would be developed by SEA during the environmental review process.

training program. It also permits the Maritime Administration (MARAD) to determine if a graduate, who wishes to defer the service obligation to attend graduate school, is eligible to receive a deferment. Their service obligation is required by law.

Need and Use of the Information: This information collected establishes overall compliance with the service obligation contract in support of the Economic Growth and Trade and National Security goals identified in the DOT Strategic Plan. Because the graduates are required to serve as commissioned officers in the U.S. Merchant Marine Reserve, U.S. Naval Reserve (as an aspect of the service obligation), they become the Navy's single largest source of naval reserve officers except for Naval R.O.T.C. In their civilian capacities, they are required first to sail on their professional merchant marine licenses or work in the maritime industry ashore. This dual role makes the graduates especially valuable because national defense planning initiatives and the Nation's economic needs depend on available personnel who are highly trained.

Description of Respondents: U.S. Merchant Marine Academy students and graduates, and subsidized students and graduates.

Annual Responses: 21.

Annual Burden: 4.2 hours.

Comments: Comments should be referred to the docket number that appears at the top of this document. Written comments may be submitted to the Docket Clerk, U.S. DOT Dockets, Room W12–140, 1200 New Jersey Avenue, SE., Washington, DC 20590. Comments also may be submitted by electronic means via the Internet at *http://www.regulations.gov*. Specifically address whether this information collection is necessary for proper performance of the functions of the agency and will have practical utility, accuracy of the burden estimates, ways to minimize this burden, and ways to enhance the quality, utility, and clarity of the information to be collected. All comments received will be available for examination at the above address between 10 a.m. and 5 p.m. *EDT* (*or EST*), Monday through Friday, except Federal holidays. An electronic version of this document is available on the World Wide Web at *http://www.regulations.gov*.

Privacy Act: Anyone is able to search the electronic form of all comments received into any of our dockets by the name of the individual submitting the comment (or signing the comment, if submitted on behalf of an association, business, labor union, etc.). You may review DOT's complete Privacy Act Statement in the **Federal Register** published on April 11, 2000 (Volume 65, Number 70; Pages 19477–78) or you may visit *http://www.regulations.gov*.

Authority: 49 CFR 1.66.

By order of the Maritime Administrator.

Dated: November 20, 2007.

Christine S. Gurland,

Acting Secretary, Maritime Administration.

DEPARTMENT OF TRANSPORTATION

Surface Transportation Board

[STB Finance Docket No. 35087]

Canadian National Railway Company and Grand Trunk Corporation—Control—EJ&E West Company [1]

AGENCY: Surface Transportation Board, DOT.

ACTION: Decision No. 2 in STB Finance Docket No. 35087; Notice of Acceptance of Primary Application and Related Filings; Issuance of Procedural Schedule.

SUMMARY: The Surface Transportation Board (Board) is accepting for consideration the primary application filed October 30, 2007, by Canadian National Railway Corporation (CNR) and Grand Trunk Corporation (GTC), a noncarrier holding company through which CNR controls its U.S. rail subsidiaries, and seven related filings. The primary application seeks Board approval under 49 U.S.C. 11321–26 of the acquisition of control of EJ&E West Company (EJ&EW), a wholly owned noncarrier subsidiary of Elgin, Joliet and Eastern Railway Company (EJ&E), by CNR and GTC. This proposal is referred to as the Control Transaction, and CNR and GTC are referred to collectively as applicants.

The related filings are notices of exemption involving an intra-corporate family transaction and the granting of trackage rights. The Sub-No. 1 filing provides for EJ&E to transfer property to EJ&EW, which, at that time, would become a rail common carrier, prior to applicants acquiring control of EJ&EW. The Sub-Nos. 2 through 7 filings provide for grants of trackage rights by EJ&EW to Grand Trunk Western Railroad (GTW), Illinois Central Railroad Company (IC), Chicago, Central & Pacific Railroad Company (CCP), and Wisconsin Central Ltd. (WCL), and by IC and CCP to EJ&EW, promptly upon applicants' acquisition of control of EJ&EW, should the Board approve the proposed Control Transaction.

The Board finds that the Control Transaction is a ''minor transaction'' under 49 CFR 1180.2(c), and adopts a procedural schedule for consideration of the application. In finding that the transaction is a minor transaction, the Board has preliminarily determined that any anticompetitive effects of the transaction will clearly be outweighed by the transaction's anticipated contribution to the public interest in meeting significant transportation needs. 49 CFR 1180.2(b)(2). The Board makes this determination based solely on evidence presented in the application. The Board stresses that this is not a final determination, and its finding may be rebutted by filings and evidence submitted into the record for this proceeding. The Board will give careful consideration to any claims that the transaction will have anticompetitive effects that are not apparent from the application itself.

Moreover, the Board has determined to prepare an Environmental Impact Statement (EIS) with respect to the transaction.

DATES: The effective date of this decision is November 29, 2007. Any person who wishes to participate in this proceeding as a party of record (POR) must file, no later than December 13, 2007, a notice of intent to participate. All comments, protests, requests for conditions, and any other evidence and argument in opposition to the primary application and related filings, including filings by the U.S. Department of Justice (DOJ) and the U.S. Department of Transportation (DOT), must be filed by January 28, 2008. Responses to comments, protests, requests for conditions, and other opposition, and rebuttal in support of the primary application or related filings must be filed by March 13, 2008. If a public

[1] This decision also embraces *Elgin, Joliet and Eastern Railway Company—Corporate Family Exemption—EJ&E West Company*, STB Finance Docket No. 35087 (Sub-No. 1); *Chicago, Central & Pacific Railroad Company—Trackage Rights Exemption—EJ&E West Company*, STB Finance Docket No. 35087 (Sub-No. 2); *Grand Trunk Western Railroad Incorporated—Trackage Rights Exemption—EJ&E West Company*, STB Finance Docket No. 35087 (Sub-No. 3); *Illinois Central Railroad Company—Trackage Rights Exemption—EJ&E West Company*, STB Finance Docket No. 35087 (Sub-No. 4); *Wisconsin Central Ltd.—Trackage Rights Exemption—EJ&E West Company*, STB Finance Docket No. 35087 (Sub-No. 5); *EJ&E West Company—Trackage Rights Exemption—Chicago, Central & Pacific Railroad Company*, STB Finance Docket No. 35087 (Sub-No. 6); and *EJ&E West Company—Trackage Rights Exemption—Illinois Central Railroad Company*, STB Finance Docket No. 35087 (Sub-No. 7).

hearing or oral argument is held, it will be held on a date to be determined by the Board. Under 49 U.S.C. 11325(d)(2), a final decision would be issued by April 25, 2008; however, the Board is also required to accommodate in its decisionmaking the requirements of the National Environmental Policy Act (NEPA), 42 U.S.C. 4321 *et seq.* Thus, the Board will not issue a final decision on the merits of the application until the environmental review is completed, including preparation of an EIS and a substantial opportunity for public comment and participation. For further information respecting dates, see Appendix A (Procedural Schedule).

ADDRESSES: Any filing submitted in this proceeding must be submitted either via the Board's e-filing format or in the traditional paper format. Any person using e-filing should attach a document and otherwise comply with the instructions found on the Board's Web site at *http://www.stb.dot.gov* at the ''E-FILING'' link. Any person submitting a filing in the traditional paper format should send an original and 10 paper copies of the filing (and also an electronic version) to: Surface Transportation Board, 395 E Street, SW., Washington, DC 20423–0001. In addition, one copy of each filing in this proceeding must be sent (and may be sent by e-mail only if service by e-mail is acceptable to the recipient) to each of the following: (1) Secretary of Transportation, 1200 New Jersey Avenue, SE., Washington, DC 20590; (2) Attorney General of the United States, c/o Assistant Attorney General, Antitrust Division, Room 3109, Department of Justice, Washington, DC 20530; (3) Paul A. Cunningham (representing CNR and GTC), Harkins Cunningham LLP, 1700 K Street, NW., Suite 400, Washington, DC 20006–3804; and (4) any other person designated as a POR on the service list notice (as explained below, the service list notice will be issued as soon after December 13, 2007, as practicable).

FOR FURTHER INFORMATION CONTACT: Julia M. Farr, (202) 245–0359. [Assistance for the hearing impaired is available through the Federal Information Relay Service (FIRS) at 1–800–877–8339.]

SUPPLEMENTARY INFORMATION: CNR is one of Canada's two major railroads, extending from Halifax, Nova Scotia, on the Atlantic to Vancouver and Prince Rupert, British Columbia, on the Pacific. Through its GTC subsidiary, CNR controls the following rail carriers: GTW, IC, CCP, WCL, Duluth, Winnipeg and Pacific Railway Company (DWP), St. Clair Tunnel Company (SCTC), Cedar River Railroad Company (CRRC), Waterloo Railway Company (Waterloo), Sault Ste. Marie Bridge Company (SSMB), Wisconsin Chicago Link Ltd. (WCLL), Duluth, Missabe and Iron Range Railway Company (DMIR), Bessemer and Lake Erie Railroad Company (B&LE), and The Pittsburgh & Conneaut Dock Company (P&C Dock). DWP extends the applicants' system from the international border at Duluth Junction/Ranier over DWP's own lines to Nopeming Junction, MN. GTW also extends applicants' system to Chicago from the international border at Port Huron/Sarnia and Detroit/Windsor. In 1999, applicants acquired IC, thus extending applicants' system from Chicago to the Gulf Coast, and becoming part of a North American Free Trade Agreement (NAFTA) rail network offering shippers access to Kansas City Southern de México, S.A. de C.V. (KCSM), Mexico's largest rail system. In 2001, applicants acquired WCL and its affiliates, and in 2004 applicants acquired the Great Lakes Transportation LLC (GLT) carriers including DMIR, thus providing applicants with a connection between Chicago and applicants' lines west of the Great Lakes. In the GLT transaction, applicants also acquired B&LE and P&C Dock, which, together with applicants' ownership of DMIR and Great Lakes Fleet, LLC (a water carrier operating on the Great Lakes), provides applicants a continuous supply chain for iron ore moving from the Missabe Iron Range of Minnesota to the Union Railroad Company, which serves the Edgar Thompson Steel Works of United States Steel Corporation (USS) in Braddock, PA.

EJ&EW is an Illinois corporation formed on August 16, 2007, and is a wholly owned noncarrier subsidiary of EJ&E. EJ&E is a Class II railroad that currently operates over 198 miles of track in Northeastern Illinois and Northwestern Indiana, consisting primarily of an arc around Chicago, IL, extending from Waukegan, IL, southwards to Joliet, IL, then eastward to Gary, IN, and then northwest to South Chicago along Lake Michigan. EJ&E provides rail service to approximately 100 customers, including steel mills, coal utilities, plastics, and chemical producers, steel processors, distribution centers, and scrap processors. EJ&E is a wholly owned indirect subsidiary of USS, a noncarrier. USS owns all of the issued and outstanding stock of Transtar, Inc. (Transtar), a noncarrier holding company, which owns all of the issued and outstanding stock of seven common carrier railroads, including EJ&E.[2]

Before applicants acquire control of EJ&EW, EJ&E plans to transfer all of its land, rail, and related assets located west of the centerline of Buchanan Street in Gary (together with the real property and related fixtures associated with the hump and Dixie leads located east of Buchanan Street) to EJ&EW, which at that time would become a rail common carrier. As noted above, this transaction is the subject of the Sub-No. 1 related filing. EJ&E would retain its land, rail, and related assets east of the centerline (other than the real property and related fixtures associated with the hump and Dixie leads). It is expected that, if the Control Transaction is approved and applicants acquire control of EJ&EW, EJ&E would change its name to Gary Railway Company, and EJ&EW would assume the Elgin, Joliet & Eastern Railway Company name.

In order to permit trains of its operating subsidiaries—GTW, IC, CCP, and WCL—to operate over EJ&EW's line and provide for maximum operational flexibility, applicants intend to cause EJ&EW to grant trackage rights to those subsidiaries over the entire length of EJ&EW from Waukegan to Gary. Applicants also intend to grant EJ&EW trackage rights over selected portions of its CCP and IC subsidiaries. These proposed trackage rights are the subjects of notices of exemption in the related filings Sub-Nos. 2 through 7, providing for grants of trackage rights by EJ&EW to GTW, IC, CCP, and WCL and by IC and CCP to EJ&EW.

GTC and EJ&E have entered into a Stock Purchase Agreement (Agreement), dated as of September 25, 2007. The Agreement provides that, subject to Board authorization of the Control Transaction, and other conditions, GTC will purchase from EJ&E all of the issued and outstanding common stock of EJ&EW for an overall purchase price of $300 million, subject to adjustments as provided for in the Agreement.

Applicants state three primary purposes for pursuing the Control Transaction. First, they believe the Control Transaction would improve their operations in and beyond the Chicago area by providing CNR with a continuous rail route around Chicago, under applicants' ownership, that would connect the five CNR lines that presently radiate from Chicago. Second, acquiring EJ&E's rail assets would make

[2] In 2001, Transtar spun off its interest in B&LE, DMIR, P&C Dock, and a water carrier, Great Lakes Fleet, to GLT, which became a holding company controlled by the Blackstone Group. In 2004, in a transaction unrelated to USS, applicants acquired the GLT subsidiaries.

available to applicants EJ&E's Kirk Yard—an automated classification facility in Gary—as well as smaller facilities in Joliet and Whiting, IN, thus enabling applicants to consolidate car classification work at Kirk and East Joliet Yards and to reduce use of the Belt Railway Company of Chicago's (BRC) Clearing Yard. Lastly, applicants state that their system would benefit from the fact that EJ&E provides an important supply line for North American steel, chemical, and petrochemical industries, as well as for Chicago area utilities and others, which would allow applicants to develop closer and more extensive relationships with companies in and serving those industries.

Financial Arrangements. No new securities have been or would be issued in connection with applicants' acquisition of control of EJ&EW. Under the Agreement, the purchase price would be paid in cash on the closing date. Applicants anticipate that they would finance the Control Transaction with debt and cash on hand.

Passenger Service Impacts. Applicants state that the Control Transaction would not affect passenger rail service operating on CNR rail lines today; rather, applicants anticipate reduced freight train traffic on CNR lines inside the EJ&E arc, which would benefit passenger operations over those lines. Once applicants cease operations on the St. Charles Air Line Route, applicants state that the National Railroad Passenger Corporation (Amtrak) would be the only remaining regular user of that route. Before the line can be formally abandoned, Amtrak trains would need to be re-routed to Norfolk Southern Railway Company's line, as has been planned in connection with the Chicago Region Environmental and Transportation Efficiency (CREATE) Project. Applicants state that EJ&E lines are not used for intercity or commuter passenger rail service, though EJ&E does cross, at grade, several corridors of the Commuter Rail Division of the Regional Transportation Authority of Northeast Illinois (Metra). Applicants state that they would work with Metra and the host freight operators to coordinate operations and adjust operating windows so that the needs of all users can be met. Applicants also note that they are aware that Metra is studying the feasibility of using a portion of the EJ&E corridor for future light-rail commuter service. Applicants state that they would explore options to further Metra's goal of extended commuter train service while accommodating applicants' need to move its freight traffic more efficiently through and around Chicago.

Market Analysis. The primary application included market analyses that contend that there would be no reduction in direct rail competition between CNR and EJ&E as a result of this acquisition. Applicants analyzed stations and interchange points served by both CNR and EJ&E and concluded that there are no cases of 2 to 1 or 3 to 2 reductions in shipper rail options. In addition, applicants submitted a detailed geographic market study of origin and destination markets showing that the acquisition would not increase market concentration.

Discontinuances/Abandonments. Applicants state that they do not anticipate any transaction-related line abandonments. Although applicants intend to re-route all their trains currently operating over the St. Charles Air Line, a formal abandonment of that line would require coordination with BNSF Railway Company (BNSF) and Union Pacific Railroad Company, which own the line jointly with applicants, and with existing users such as Amtrak.

Public Interest Considerations. Applicants state that the Control Transaction would promote the public interest in a more efficient and reliable rail transportation system, and would have no adverse competitive, safety, or other effects. Applicants assert that the Control Transaction would have no anticompetitive effects in that it would connect two transportation systems that do not compete but instead complement each other and would together create a stronger network. Applicants assert that there would be no 2-to-1 shippers, nor 3-to-2 shippers, on the CNR/EJ&EW system. Moreover, applicants state that the Control Transaction would bring about no vertical foreclosure, no reduction in effective geographic competition, and no increase in market power. Applicants state that, as in past transactions, they are committed to keeping gateways open and honoring trackage rights and haulage agreements with all connecting carriers.

Applicants assert that, even if the Control Transaction had any adverse impacts on competition, those effects would be outweighed by its transportation benefits. The Control Transaction, applicants assert, would ensure more efficient and reliable rail transportation at a lower cost and would, over time, reduce rail traffic congestion, increase rail capacity for carriers operating in Chicago, and reduce traffic density in Chicago's urban core. Applicants state that the Control Transaction would provide CNR with a continuous route around Chicago, which would make it possible for CNR traffic to bypass the congested Chicago terminal. Applicants maintain that this rerouting would benefit CNR-served customers in the Chicago area and customers served by other Class I railroads by reducing the demand on the capacity of BRC, Indiana Harbor Belt Railroad (IHB), and other CNR lines through the central Chicago terminal area. Further, applicants note, the availability of a continuous CNR route around Chicago would greatly improve the fluidity of intermodal and other CNR traffic that must move to, from, or through Chicago. Also, the availability of a continuous CNR route around Chicago would advance the congestion-reducing objectives of the CREATE Project and make it possible for applicants to more quickly cease operations over the St. Charles Air Line. The Control Transaction, applicants state, would also eliminate interchanges between EJ&E and CNR, making possible single-line service for approximately 10,000 carloads that the two railroads now carry in interline service each year. Applicants also note that the public would benefit from applicants' plans to spend approximately $100 million to upgrade EJ&E's infrastructure.

Time Schedule for Consummation. Applicants intend to consummate control of EJ&EW as soon as possible after the effective date of the final order, should the Board authorize the proposed Control Transaction. Applicants expect to have fully implemented the Control Transaction within three years after consummation of their acquisition of control over EJ&EW.

Environmental Impacts. Applicants concede that environmental review under NEPA is necessary in this case. As discussed below, the increased traffic that would result from this transaction would substantially exceed the Board's thresholds for environmental review. Due to the potentially significant impact that this transaction may have on the environment and communities in the affected area, the Board will prepare a full EIS. Applicants also have agreed to prepare a Safety Integration Plan (SIP), pursuant to the Board's regulations at 49 CFR 1106, which will be addressed in the EIS. In the SIP, applicants will specify how they would ensure safe operations during the acquisition and implementation process. Applicants state that the transaction would have no adverse impact on historic properties, as there are no line abandonments and no elimination of duplicative rail facilities involved in the proposed transaction,

and that, therefore, there is no need for historic review under the National Historic Preservation Act of 1966 (NHPA), 16 U.S.C. 470. Based on the available information, it does not appear that historic review is required in this case.

Labor Impacts. Applicants anticipate two principal labor impacts as a result of the Control Transaction: The elimination of redundant positions and the organization/integration of forces to realize the efficiencies of the transaction. Applicants estimate that the Control Transaction would result in the elimination of 114 positions. Applicants anticipate that, to the extent the transaction leads to the elimination of positions, most of these impacts could be accommodated through normal attrition during the implementation period. Applicants' continuing need for experienced, skilled railroaders at its neighboring Chicago operations makes it highly likely that most of the affected employees would have the opportunity to fill other positions opening up elsewhere in applicants' Chicago operation. Applicants state they would work with the respective collective bargaining units to attempt to secure labor implementing agreements that would provide for the flexibility to fully employ any potentially adversely impacted employee. Applicants further acknowledge that the Control Transaction would be subject to employee protective conditions and other procedures adopted in *New York Dock Ry.—Control—Brooklyn Eastern District Terminal, 360 I.C.C. 60, aff'd sub nom. New York Dock Ry.* v. *United States,* 609 F.2d 83 (2d Cir. 1979) (*New York Dock*).

Related Filings. In connection with this transaction, several notices of exemption were filed under 49 CFR 1180.2(d)(3) and 1180.2(d)(7).

Sub-No. 1. In Sub-No. 1, EJ&E filed a verified notice of exemption under 49 CFR 1180.2(d)(3) for a transaction within a corporate family. Under this notice of exemption, EJ&E will transfer all its land, rail, and related assets located west of the centerline of Buchanan Street in Gary, IN (together with the real property and related fixtures associated with the hump and Dixie leads located east of Buchanan Street), to EJ&EW, which upon completion of the transfers would become a rail carrier. EJ&E will retain its land, rail, and related assets east of the centerline (other than the real property and related fixtures associated with the hump and Dixie leads). EJ&E intends to consummate the transaction with EJ&EW immediately before CNR and GTC acquire control of EJ&EW, which would not occur until after approval of the Control Transaction by the Board. The purpose of the transaction is that it would allow EJ&E to segregate into a separate corporate entity (EJ&EW) the rail properties to be acquired by GTC, thus facilitating the transaction described in the primary application. According to EJ&E, this is a transaction within a corporate family of the type specifically exempted from prior review and approval under 49 CFR 1180.2(d)(3). As a condition to use of this exemption, EJ&E states that any employees adversely affected by the transaction will be protected by the conditions set forth in *New York Dock.*

Sub-No. 2. In Sub-No. 2, CCP submits a verified notice of exemption under 49 CFR 1180.2(d)(7). Pursuant to a written trackage rights agreement, EJ&EW would grant CCP trackage rights over all of EJ&EW's line, which runs between milepost 74.6 at Waukegan, IL, and milepost 45.4 at Gary, IN, including all trackage west of the centerline of Buchanan Street in Gary, IN, plus trackage associated with the hump and Dixie leads located east of Buchanan Street, a distance approximately 120 miles. Parties intend to execute the trackage rights agreement promptly upon applicants' acquisition of control of EJ&EW, should the Board approve the proposed Control Transaction. As a condition to this exemption, CCP states that any employees affected by the acquisition of the temporary trackage rights will be protected by the conditions imposed in *Norfolk and Western Ry. Co.—Trackage Rights—BN,* 354 I.C.C. 605 (1978), *as modified in Mendocino Coast Ry., Inc.—Lease and Operate,* 360 I.C.C. 653 (1980).

Sub-No. 3. In Sub-No. 3, GTW submits a verified notice of exemption under 49 CFR 1180.2(d)(7). Pursuant to a written trackage rights agreement, EJ&EW would grant GTW trackage rights over EJ&EW's lines between milepost 74.6 at Waukegan, IL, and milepost 45.4 at Gary, IN, including all trackage west of the centerline of Buchanan Street in Gary, IN, plus trackage associated with the hump and Dixie leads located east of Buchanan Street.[3] Parties intend to execute the trackage rights agreement promptly upon applicants' acquisition of control of EJ&EW, should the Board approve the proposed Control Transaction. As a condition to this exemption, GTW states that any employees affected by the acquisition of the temporary trackage rights will be protected by the conditions imposed in *Norfolk and Western Ry. Co.—Trackage Rights—BN*, 354 I.C.C. 605 (1978), *as modified in Mendocino Coast Ry., Inc.—Lease and Operate*, 360 I.C.C. 653 (1980).

Sub-No. 4. In Sub-No. 4, IC submits a verified notice of exemption under 49 CFR 1180.2(d)(7). Pursuant to a written trackage rights agreement, EJ&EW would grant IC trackage rights over EJ&EW's lines between milepost 74.6 at Waukegan, IL, and milepost 45.4 at Gary, IN, including all trackage west of the centerline of Buchanan Street in Gary, IN, plus trackage associated with the hump and Dixie leads located east of Buchanan Street. Parties intend to execute the trackage rights agreement promptly upon applicants' acquisition of control of EJ&EW, should the Board approve the proposed Control Transaction. As a condition to this exemption, IC states that any employees affected by the acquisition of the temporary trackage rights will be protected by the conditions imposed in *Norfolk and Western Ry. Co.—Trackage Rights—BN*, 354 I.C.C. 605 (1978), *as modified in Mendocino Coast Ry., Inc.—Lease and Operate*, 360 I.C.C. 653 (1980).

Sub-No. 5. In Sub-No. 5, WCL submits a verified notice of exemption under 49 CFR 1180.2(d)(7). Pursuant to a written trackage rights agreement, EJ&EW would grant WCL trackage rights over EJ&EW's lines between milepost 74.6 at Waukegan, IL, and milepost 45.4 at Gary, IN, including all trackage west of the centerline of Buchanan Street in Gary, IN, plus trackage associated with the hump and Dixie leads located east of Buchanan Street. Parties intend to execute the trackage rights agreement promptly upon applicants' acquisition of control of EJ&EW, should the Board approve the proposed Control Transaction. As a condition to this exemption, WCL states that any employees affected by the acquisition of the temporary trackage rights will be protected by the conditions imposed in *Norfolk and Western Ry. Co.—Trackage Rights—BN,* 354 I.C.C. 605 (1978), *as modified in Mendocino Coast Ry., Inc.—Lease and Operate*, 360 I.C.C. 653 (1980).

Sub-No. 6. In Sub-No. 6, CNR submits a verified notice of exemption under 49 CFR 1180.2(d)(7). Pursuant to a written trackage rights agreement, CCP would grant EJ&EW trackage rights over CCP's lines between milepost 35.7 at Munger, IL, and milepost 8.3 at Belt Crossing, IL. Parties intend to execute the trackage rights agreement promptly upon applicants' acquisition of control of EJ&EW, should the Board approve the

[3] GTW currently has trackage rights over EJ&E lines between milepost 36.2 at Griffith, IN, and milepost 24.0 at Eola, IL, which EJ&EW would acquire under Sub-No. 1.

proposed Control Transaction. As a condition to this exemption, CNR states that any employees affected by the acquisition of the temporary trackage rights will be protected by the conditions imposed in *Norfolk and Western Ry. Co.—Trackage Rights—BN*, 354 I.C.C. 605 (1978), *as modified in Mendocino Coast Ry., Inc.—Lease and Operate*, 360 I.C.C. 653 (1980).

Sub-No. 7. In Sub-No. 7, CNR submits a verified notice of exemption under 49 CFR 1180.2(d)(7). Pursuant to a written trackage rights agreement, IC would grant EJ&EW trackage rights over IC's lines between milepost 17.9 at Highlawn, IL, and milepost 31.4 at University Park, IL, and between milepost 36.7 at Joliet, IL, and milepost 7.9 at Lemoyne, IL. Parties intend to execute the trackage rights agreement promptly upon applicants' acquisition of control of EJ&EW, should the Board approve the proposed Control Transaction. As a condition to this exemption, CNR states that any employees affected by the acquisition of the temporary trackage rights will be protected by the conditions imposed in *Norfolk and Western Ry. Co.—Trackage Rights—BN*, 354 I.C.C. 605 (1978), *as modified in Mendocino Coast Ry., Inc.—Lease and Operate*, 360 I.C.C. 653 (1980).

Primary Application and Related Filings Accepted. The Board finds that the proposed Control Transaction would be a ''minor transaction'' under 49 CFR 1180.2(c), and the Board accepts the primary application for consideration because it is in substantial compliance with the applicable regulations governing minor transactions. See 49 U.S.C. 11321–26; 49 CFR part 1180. The Board is also accepting for consideration the seven related filings, which are also in compliance with the applicable regulations. The Board reserves the right to require the filing of supplemental information as necessary to complete the record.

The Board has received comments in support of the Control Transaction, as well as comments both opposing and supporting the ''minor transaction'' designation.[4] On November 8, 2007, Congressman Peter J. Visclosky submitted a comment with his notice of intent to participate in the proceeding, stating his belief that the Board should treat the Control Transaction as a significant transaction, in order to give those affected in Northwestern Indiana ample opportunity to analyze the impacts of the proposed purchase and comment accordingly. On November 21, 2007, Congresswoman Melissa L. Bean also submitted a comment with her notice of intent to participate urging the Board to treat the Control Transaction as a significant transaction. In addition, Congresswoman Bean requested that an EIS be prepared in connection with the proposed transaction and supported a local field hearing where the concerns of affected citizens and communities could be heard.

On November 19, 2007, Aux Sable Liquid Products, Inc. (Aux Sable) filed a reply in opposition to applicants' request that the Control Transaction be considered a minor transaction. Aux Sable argues that the Control Transaction should be found to be a significant transaction because the proposed transaction would eliminate EJ&E as a neutral switching carrier that provides efficient, economical, and nondiscriminatory access to numerous Class I railroads and short lines.

On November 21, 2007, applicants filed a reply in opposition to the arguments offered by Congressman Visclosky and Aux Sable to the effect that the proposed transaction should be deemed significant. Applicants assert that these parties' arguments present no justification for finding the proposed transaction to be anything other than minor.

The statute and Board regulations treat a transaction that does not involve two or more Class I railroads differently depending upon whether or not the transaction would have ''regional or national transportation significance.'' 49 U.S.C. 11325. Under our regulations, at 49 CFR 1180.2, a transaction that does not involve two or more Class I railroads is to be classified as ''minor''—and thus not having regional or national transportation significance—if a determination can be made either: (1) That the transaction clearly will not have any anticompetitive effects, or (2) that any anticompetitive effects will clearly be outweighed by the anticipated contribution to the public interest in meeting significant transportation needs. A transaction not involving the control or merger of two or more Class I railroads is ''significant'' if neither of these determinations can clearly be made.

The Board finds the proposed Control Transaction to be a ''minor transaction'' because it appears on the face of the application that the efficiency and other public interest benefits would clearly outweigh whatever anticompetitive effects may exist. Today much of CNR's traffic moving between its various components must travel through downtown Chicago. With this acquisition, applicants propose to reroute most of their traffic around Chicago, relieving congestion on crowded downtown track. According to applicants' operating plan, the EJ&E is currently lightly used. Applicants indicate that they could increase use of EJ&E's line by adding more CNR traffic while maintaining existing levels of other traffic. Further, the transaction does not appear to pose any significant anticompetitive effects. There is virtually no overlap; EJ&E and the applicants' rail lines do not appear to serve any shippers in common. Applicants also state their commitment to keeping gateways open and honoring trackage rights and haulage agreements with all connecting carriers so that other railroads would be able to continue to use their trackage rights on the EJ&E after completion of the Control Transaction.

The Board reiterates, however, that its findings regarding the anticompetitive impact are preliminary. The Board will give careful consideration to any claims that the transaction will have anticompetitive effects that are not apparent from the application itself. Moreover, the schedule established by the Board gives Aux Sable the opportunity to present its evidence on the issue of nondiscriminatory access and for the Board to consider the issue. In response to Congressman Visclosky's comment, the Board notes that the proposed schedule is contingent upon completion of a full environmental review process. As discussed, the Board has decided to prepare a full EIS in this proceeding that will ensure that the Board takes the hard look at environmental consequences required

[4] Several parties have provided statements in support of the transaction. On November 9, 2007, applicants submitted the verified statements of Consumers Energy Company, Erco Worldwide, and Millar Western Forest Products Ltd, in support of the proposed Control Transaction. On November 19, 2007, applicants submitted verified statements in support of the Control Transaction from A&R Transport, Inc., Behr Iron & Steel, Inc., Consolidated Grain and Barge Enterprises, Inc., Hapag-Lloyd (America) Inc., Louisiana Pacific Corporation, Major-Prime Plastics, Inc., Ozinga Transportation, Inc., Parkdale International Ltd., and Verso Paper. Also on November 19, 2007, Metropolitan Milwaukee Association of Commerce (MMAC) submitted a verified statement in support of the Control Transaction. On November 20, 2007, applicants submitted the verified statement of ATC Pembroke, Inc., in support of the proposed transaction. In a letter filed on November 21, 2007, the Chicagoland Chamber of Commerce (Chicagoland Chamber) expressed its support of the Control Transaction. Also on November 21, 2007, the Fond du lac Area Chamber of Commerce submitted a verified statement supporting the transaction and applicants submitted a letter from Michigan Governor Jennifer M. Granholm supporting the transaction. Governor Granholm, A&R Transport, Inc., MMAC, Chicagoland Chamber, and the Fond du lac Area Chamber of Commerce urge the Board to treat the proposed transaction as a minor transaction.

by NEPA, which is warranted in view of the large projected traffic increases on certain line segments, and the potential impacts of the proposed transaction on a number of communities that would likely result from the increased activity levels on rail line segments and at rail facilities. As part of the NEPA process, the Board will consider whether to impose specific environmental conditions, should it decide to authorize this proposal, to mitigate potential environmental impacts resulting from the proposed transaction.

Although the Board finds that the application is in substantial compliance with the applicable regulations, applicants have not submitted the information required under 49 CFR 1180.11. Applicants should submit this information to the Board by December 6, 2007.

Public Inspection. The primary application and related filings are available for inspection in the library (Room 131) at the offices of the Surface Transportation Board, 395 E Street, SW., in Washington, DC. In addition, the primary application and related filings may be obtained from Mr. Cunningham (representing CNR and GTC) at the address indicated above.

Procedural Schedule. The Board has considered applicants' request (filed October 30, 2007) for an expedited procedural schedule, under which the Board would issue its final decision before the statutory deadline of 180 days after the filing of the primary application.

On November 19, 2007, the Village of Barrington, IL (Barrington) filed a reply, urging the Board to develop an EIS and adopt a schedule that allows sufficient time to prepare an EIS, including sufficient time for preparation of a scoping notice, a Draft EIS, and Final EIS. On November 21, 2007, applicants responded, contending that the Board lacks sufficient information to decide now whether an EIS is needed in this case.

On November 20, 2007, BNSF submitted comments on applicants' suggested expedited procedural schedule, requesting that the Board set a procedural schedule that provides for sufficient time for consideration of the potential impacts of the proposed transaction and for negotiations with applicants to ensure that the interests of connecting railroads and their shippers are protected. On November 21, 2007, applicants responded, arguing that BNSF's concerns do not warrant lengthening the procedural schedule proposed by the applicants.

The Board denies applicants' request for an expedited procedural schedule and is adopting a procedural schedule, under which the Board would issue its final decision by April 25, 2008, provided that the environmental review process described below is complete. The Board's schedule also provides that any necessary oral argument or public hearing will be held on a date to be determined by the Board.

Under the procedural schedule adopted by the Board: any person who wishes to participate in this proceeding as a POR must file a notice of intent to participate no later than December 13, 2007; all comments, protests, requests for conditions, and any other evidence and argument in opposition to the primary application or related filings, including filings by DOJ and DOT, must be filed by January 28, 2008; and responses to comments, protests, requests for conditions, and other opposition and rebuttal in support of the primary application or related filings must be filed by March 13, 2008. As in past proceedings, DOJ and DOT will be allowed to file, on the response due date (here, March 13), their comments in response to the comments of other parties, and applicants will be allowed to file (as quickly as possible thereafter) a response to any such comments filed by DOJ and/or DOT. Under this schedule, a public hearing or oral argument may be held on a date to be determined by the Board. The Board plans to issue its final decision by April 25, 2008, and make any such approval effective by May 25, 2008, but those dates may be extended as required to accommodate completion of the environmental review process under NEPA, including preparation of an EIS and a full opportunity for public comment and participation. For further information respecting dates, see Appendix A (Procedural Schedule).

Notice of Intent to Participate. Any person who wishes to participate in this proceeding as a POR must file with the Board, no later than December 13, 2007, a notice of intent to participate, accompanied by a certificate of service indicating that the notice has been properly served on the Secretary of Transportation, the Attorney General of the United States, and Mr. Cunningham (representing CNR and GTC).

If a request is made in the notice of intent to participate to have more than one name added to the service list as a POR representing a particular entity, the extra name will be added to the service list as a ''Non-Party.'' The list will reflect the Board's policy of allowing only one official representative per party to be placed on the service list, as specified in Press Release No. 97–68 dated August 18, 1997, announcing the implementation of the Board's ''One Party-One Representative'' policy for service lists. Any person designated as a Non-Party will receive copies of Board decisions, orders, and notices but not copies of official filings. Persons seeking to change their status must accompany that request with a written certification that he or she has complied with the service requirements set forth at 49 CFR 1180.4, and any other requirements set forth in this decision.

Service List Notice. The Board will serve, as soon after December 13, 2007, as practicable, a notice containing the official service list (the service-list notice). Each POR will be required to serve upon all other PORs, within 10 days of the service date of the service-list notice, copies of all filings previously submitted by that party (to the extent such filings have not previously been served upon such other parties). Each POR also will be required to file with the Board, within 10 days of the service date of the service-list notice, a certificate of service indicating that the service required by the preceding sentence has been accomplished. Every filing made by a POR after the service date of the service-list notice must have its own certificate of service indicating that all PORs on the service list have been served with a copy of the filing. Members of the United States Congress (MOCs) and Governors (GOVs) are not parties of record and need not be served with copies of filings, unless any Member or Governor has requested to be, and is designated as, a POR.

Comments, Protests, Requests for Conditions, and Other Opposition Evidence and Argument, Including Filings by DOJ and DOT. All comments, protests, requests for conditions, and any other evidence and argument in opposition to the primary application or related filings, including filings by DOJ and DOT, must be filed by January 28, 2008.

Because the Transaction proposed in the application is a minor transaction, no responsive applications will be permitted. *See* 49 CFR 1180.4(d)(1).

Protesting parties are advised that, if they seek either the denial of the application or the imposition of conditions upon any approval thereof, on the theory that approval (or approval without conditions) would harm competition and/or their ability to provide essential services, they must present substantial evidence in support of their positions. *See Lamoille Valley R.R. Co.* v. *ICC*, 711 F.2d 295 (D.C. Cir. 1983).

Responses to Comments, Protests, Requests for Conditions, and Other

Opposition; Rebuttal in Support of the Primary Application or Related Filings. Responses to comments, protests, requests for conditions, and other opposition submissions, and rebuttal in support of the primary application or related filings must be filed by March 13, 2008.

Public Hearing/Oral Argument. The Board may hold a public hearing or an oral argument in this proceeding on a date to be determined by the Board.

Discovery. Discovery may begin immediately. The parties are encouraged to resolve all discovery matters expeditiously and amicably.

Environmental Matters. NEPA requires that the Board take environmental considerations into account in its decisionmaking. Under both the regulations of the President's Council on Environmental Quality implementing NEPA and the Board's own environmental rules, actions are separated into three classes that prescribe the level of documentation required in the NEPA process. Actions that may significantly affect the environment generally require the Board to prepare an EIS.[5] Actions that may or may not have a significant environmental impact ordinarily require the Board to prepare a more limited Environmental Assessment (EA).[6] Finally, actions whose environmental effects are ordinarily insignificant may be excluded from NEPA review across the board, without a case-by-case review. As pertinent here, an acquisition transaction normally requires the preparation of an EA or EIS where certain thresholds would be exceeded.

The thresholds differ depending on whether a rail line segment is in an area designated as in ''attainment'' or ''nonattainment'' with the National Ambient Air Quality Standards established under the Clean Air Act. Because the EJ&E lines that currently move through Chicago, and the lines of the proposed EJ&EW, are located in nonattainment areas, environmental documentation typically is required where the proposed action would result in: (1) An increase of at least 3 trains per day, (2) an increase in rail traffic of at least 50 percent (measured in annual gross ton miles), or (3) an increase in carload activity at rail yards of at least 20 percent. *See* 49 CFR 1105.7(e)(5)(ii).[7] The application indicates that the thresholds for environmental review would be exceeded here, and applicants agree that the preparation of either an EA or EIS is warranted in this proceeding.[8]

Applicants explain that the most notable change that would result from the proposed transaction is the shifting of rail traffic. Although rail traffic on CNR lines inside the EJ&E arc would generally decrease, these decreases in rail traffic would be offset by substantial increases in the number of trains operated on the EJ&EW line outside Chicago. Following the full implementation of the proposed transaction (which would be phased in), the EJ&EW line outside Chicago would gain approximately 9,695 carloads of extended haul traffic within approximately 3 years of consummation.[9] Applicants state that they would also use the EJ&EW line as a cross-connecting corridor. Accordingly, applicants anticipate that 14 of the existing 18 segments of the EJ&EW line would experience increases of between 15.0 and 26.6 trains per day.[10] These increases in trains per day would significantly exceed the 3 or 8 trains per day thresholds in the Board's environmental rules.

Applicants also project large increases in annual gross ton miles per day (gtm/d) on most of the affected line segments, which would exceed the Board's tonnage increase thresholds. For example, applicants' Operating Plan shows that on the Munger to West Chicago line segment gtm/pd would change by as much as 1,185 percent.[11] Applicants state that the proposed transaction would not impair CNR's ability to handle commuter trains, passenger trains, or trackage/haulage trains currently operating on its lines.

Finally, on the integrated CNR/EJ&EW system, four train pairs would be added to EJ&E terminals (three inbound and three outbound switch trains at Kirk Yard, and one inbound and one outbound switch train at East Joliet Yard). The estimated proposed increase of 1,355 car handlings daily at the Kirk Yard (currently 685 car handlings) and the estimated addition of 709 daily car handlings at East Joliet (currently 500 car handlings) would exceed the Board's thresholds for increased car load activity at rail yards.

The NEPA Process. Based on the information provided in the application and on a number of expressions of concern for the possible impact of the proposed transaction on potentially affected communities, and after consultation with the Section of Environmental Analysis (SEA), the Board has decided that it will prepare a full EIS in this proceeding. Although this proposed transaction is deemed to be minor and is thus entitled to an abbreviated review process on the merits, the schedule will not limit the environmental review process. The Board's proposed final decision date of April 25, 2008, and effective date of May 25, 2008, will be extended as needed to complete the full environmental review process, including preparation of the EIS and public comment as discussed below.

Under NEPA, an EIS is prepared for ''major federal actions significantly affecting the quality of the human environment.'' 42 U.S.C. 4332(2)(C). An EIS normally is not required in acquisition cases; a more limited EA generally is sufficient because there are not usually significant environmental impacts from the change in ownership of the operation of existing lines. 49 CFR 1105.6(b)(4). In this case, however, a full EIS is warranted in view of the large projected traffic increases on certain line segments, and the potential impacts of the proposed transaction on a number of communities that would likely result from the increased activity levels on rail lines segments and at rail facilities.[12]

The EIS process will ensure that the Board takes the hard look at environmental consequences required by NEPA. After issuing a notice of intent to prepare an EIS, the Board will determine the scope of work for the EIS and will provide opportunities for public participation and consultation with appropriate federal, state, and local agencies and governmental entities. A Draft EIS will be prepared that will analyze in detail the potential environmental impacts of the proposed transaction and will make recommendations for environmental

[5] *See* 49 CFR 1105.4(f), 1105.10(a).

[6] *See* 49 CFR 1105.4(d), 1105.10(b).

[7] For rail lines located in attainment areas, environmental documentation normally will be prepared if the proposed action would result in (1) an increase of at least 8 trains per day, (2) an increase in rail traffic of at least 100 percent (measured in annual gross ton miles), or (3) an increase in carload activity at rail yards of at least 100 percent. *See* 49 CFR 1105.7(e)(5)(i).

[8] *See* Application at p. 33.

[9] *See* Application at p. 192. Applicants state that there would be no quantifiable traffic gains from trucks or from rail traffic not presently handled in part by the applicants. *See* Application at p. 209.

[10] *See* Applicants' Operating Plan, Attachment A.2, p. 247.

[11] *Id.*

[12] Contrary to applicants' claims, the Board has enough information about the potential environmental impacts of this project to support the decision to prepare a full EIS. Moreover, making this determination at this point should result in a shorter NEPA review than if the Board began the EA process, only to find that the potential environmental impacts warranted an EIS, and it then had to begin again with the procedural steps required for an EIS.

mitigation.[13] The public will have at least 45 days to comment on the Draft EIS. A Final EIS will then be issued that will respond to the public comments, present the results of any further environmental analysis, and incorporate final environmental mitigation recommendations.[14] The Board will consider the entire environmental record in deciding whether to authorize the transaction as proposed, deny the proposal, or grant it with conditions, including environmental mitigation conditions.

The time the EIS will take to prepare cannot be determined ahead of time because there is no way to predict in advance all of the specific issues that may arise. In prior cases, the EIS process has ranged from approximately 18 months to several years.[15]

Safety Integration Plan. Applicants state that they will work with the Federal Railroad Administration (FRA) to formulate a SIP [16] to address the safe integration of their rail lines, equipment, personnel, and operating practices. The proposed SIP will be submitted to the Board and made available for public review and comment during the EIS process, consistent with the Board's regulations at 49 CFR 1106 and 1180.1(f)(3).

Historic Review. Finally, in accordance with Section 106 of the NHPA the Board is required to determine the effects of its licensing actions on cultural resources.[17] The Board's environmental rules establish exceptions to the need for historic review in certain cases, including the sale of a rail line for the purpose of continued rail operations where further Board approval is required to abandon any service and there are no plans to dispose of or alter properties subject to the Board's jurisdiction that are 50 years old or older.[18] Applicants state that the proposed transaction fits within this exception.[19] They assert that they have no plans to alter or dispose of properties 50 or more years old, and that any future line abandonment or construction activities by applicants would be subject to the Board's jurisdiction. Based on this information, it does not appear that historic review under the NHPA is required in this case.

Filing/Service Requirements. Persons participating in this proceeding may file with the Board and serve on other parties: A notice of intent to participate (due by December 13); a certificate of service indicating service of prior pleadings on persons designated as PORs on the service-list notice (due by the 10th day after the service date of the service-list notice); any comments, protests, requests for conditions, and any other evidence and argument in opposition to the primary application or related filings (due by January 28); and any responses to comments, etc., and any rebuttal in support of the primary application or related filings (due by March 13).

Filing Requirements. Any document filed in this proceeding must be filed either via the Board's e-filing format or in the traditional paper format as provided for in the Board's rules. Any person using e-filing should attach a document and otherwise comply with the instructions found on the Board's Web site at *http://www.stb.dot.gov* at the ''E-FILING'' link. Any person filing a document in the traditional paper format should send an original and 10 paper copies of the document (and also an electronic version) to: Surface Transportation Board, 395 E Street, SW., Washington, DC 20423–0001.

Service Requirements. One copy of each document filed in this proceeding must be sent to each of the following (any copy may be sent by e-mail only if service by e-mail is acceptable to the recipient): (1) Secretary of Transportation, 1200 New Jersey Avenue, SE., Washington, DC 20590; (2) Attorney General of the United States, c/o Assistant Attorney General, Antitrust Division, Room 3109, Department of Justice, Washington, DC 20530; (3) Paul A. Cunningham (representing CNR and GTC), Harkins Cunningham LLP, 1700 K Street, NW., Suite 400, Washington, DC 20006–3804; and (4) any other person designated as a POR on the service-list notice.

Service of Decisions, Orders, and Notices. The Board will serve copies of its decisions, orders, and notices only on those persons who are designated on the official service list as either POR, MOC, GOV, or Non-Party. All other interested persons are encouraged either to secure copies of decisions, orders, and notices via the Board's Web site at *http://www.stb.dot.gov* under ''E-LIBRARY/Decisions & Notices'' or to make advance arrangements with the Board's copy contractor, ASAP Document Solutions (mailing address: Suite 103, 9332 Annapolis Rd., Lanham, MD 20706; e-mail address: *asapdc@verizon.net;* telephone number: 202–306–4004), to receive copies of decisions, orders, and notices served in this proceeding. ASAP Document Solutions will handle the collection of charges and the mailing and/or faxing of decisions, orders, and notices to persons who request this service.

Access to Filings. An interested person does not need to be on the service list to obtain a copy of the primary application or any other filing made in this proceeding. Under the Board's rules, any document filed with the Board (including applications, pleadings, etc.) shall be promptly furnished to interested persons on request, unless subject to a protective order. 49 CFR 1180.4(a)(3). The primary application and other filings in this proceeding will also be available on the Board's Web site at *http://www.stb.dot.gov* under ''E-LIBRARY/Filings.''

This action will not significantly affect either the quality of the human environment or the conservation of energy resources.

It is ordered:

1. The primary application in STB Finance Docket No. 35087 and the related filings in STB Finance Docket No. 35087 (Sub-Nos. 1 through 7) are accepted for consideration.

2. The parties to this proceeding must comply with the procedural schedule adopted by the Board in this proceeding as shown in Appendix A.

3. The parties to this proceeding must comply with the procedural requirements described in this decision.

4. This decision is effective on November 29, 2007.

Decided: November 23, 2007.

By the Board, Chairman Nottingham, Vice Chairman Buttrey, and Commissioner Mulvey. Commissioner Mulvey dissented with a separate expression.

Vernon A. Williams,

Secretary.

COMMISSIONER MULVEY, dissenting:

I would have preferred that the Board categorize this transaction as ''significant.'' In light of the configuration of Class I railroad lines, traffic flows, critical junctures the EJ&E offers in the Chicago area, and the

[13] During the environmental review process, railroad applicants have sometimes negotiated mutually acceptable agreements with affected communities and other entities, addressing specific local environmental concerns. The Board encourages voluntary agreements of this nature because they can be extremely effective in addressing specific local environmental and safety concerns. *See* 49 CFR 1180.1(f)(2).

[14] The environmental analysis will focus on the potential environmental impacts resulting from changes in activity levels on particular line segments and facilities. The Board's general practice has been to mitigate only impacts resulting directly from a proposed transaction, and not to require mitigation for existing conditions and existing railroad operations. *See* 49 CFR 1180.1(f)(1).

[15] Sometimes, environmental work has been suspended for reasons unrelated to the environmental review process.

[16] *See* 49 CFR 244.17(a) and 1106.4(a).

[17] *See* 49 CFR 1105.8.

[18] *See* 49 CFR 1105.8(b)(1).

[19] *See* Application at p. 33.

applicants' less than thorough treatment of how their consolidation would impact other carriers, I do not believe applicants have satisfied the standards necessary for the Board to categorize this transaction as ''minor.'' I recognize that the substantive standard for Board approval of ''significant'' and ''minor'' transactions is the same under 49 U.S.C. 11324(d). However, a ''significant'' categorization would have allowed interested parties and the Board to take advantage of the additional procedural safeguards provided by 49 U.S.C. 11325(c).

I have long been concerned about why the agency's categorization of consolidation transactions includes virtually no ''significant'' transactions, and only one since the early 1990's. The current standards for determining whether a consolidation transaction is ''significant'' or ''minor'' were adopted at a time when many more Class I carriers existed than do today, when the railroad industry was in a different financial posture than it is in today, and when the agency was viewed as an impediment to economic recovery of the industry. That is no longer the environment in which we consider the merits of transactions such as this. As a result, I would have preferred we handle this transaction [20] as a ''significant'' one.[21]

APPENDIX A: PROCEDURAL SCHEDULE

October 3, 2007	Motion for Protective Order filed.
October 22, 2007	Protective Order issued.
October 30, 2007	Primary Application, Related Filings, and Motion to Establish Procedural Schedule filed.
November 29, 2007	Board notice of acceptance of application published in the **Federal Register**.
December 13, 2007	Notices of intent to participate in this proceeding due.
January 28, 2008	All comments, protests, requests for conditions, and any other evidence and argument in opposition to the primary application or related filings, including filings of DOJ and DOT, due.
March 13, 2008	Responses to comments, protests, requests for conditions, and other opposition due. Rebuttal in support of the primary application or related filings due.
TBD	A public hearing or oral argument may be held.
TBD [20]	Date by which a final decision will be served.
TBD [21]	Date by which a final decision will become effective.

BILLING CODE 4915–01–P

DEPARTMENT OF TRANSPORTATION

Surface Transportation Board

[STB Finance Docket No. 35081]

Canadian Pacific Railway Company, et al.—Control—Dakota, Minnesota & Eastern Railroad Corp., et al.

AGENCY: Surface Transportation Board, DOT.

ACTION: Decision No. 3 in STB Finance Docket No. 35081; notice of proposed procedural schedule and request for comments.

SUMMARY: The Surface Transportation Board (Board) invites public comments on a proposed procedural schedule for this proceeding. On October 5, 2007, Canadian Pacific Railway Corporation (CPRC), Soo Line Holding Company, a Delaware Corporation and indirect subsidiary of CPRC (Soo Holding), Dakota, Minnesota & Eastern Railroad Corporation (DM&E), and Iowa, Chicago & Eastern Railroad Corporation, a wholly-owned rail subsidiary of DM&E (IC&E) (collectively referred to as the ''Applicants'') submitted a filing with the Board seeking approval under 49 U.S.C. 11321–26 of the acquisition of control of DM&E and IC&E by Soo Holding (and, indirectly, by CPRC). In Decision No. 2, served on November 2, 2007, and published in the **Federal Register** at 72 FR 63232–36 on November 8, 2007, the Board accepted the October 5 submission as a prefiling notification, thus allowing the Applicants to perfect their application, and provide any supplemental materials or information, on or after December 5, 2007.[1]

DATES: Written comments on the Board's proposed procedural schedule must be filed by December 10, 2007.

ADDRESSES: Any filing submitted in this proceeding must be submitted either via the Board's e-filing format or in the traditional paper format as provided for in the Board's rules. Any person using e-filing should attach a document and otherwise comply with the instructions found on the Board's Web site at *http://www.stb.dot.gov* at the ''E-FILING'' link. Any person submitting a filing in the traditional paper format should send an original and 10 paper copies of the filing (and also an electronic version) to: Surface Transportation Board, 395 E Street, SW., Washington, DC 20423–0001. In addition, one copy of each filing in this proceeding must be sent (and may be sent by e-mail only if service by e-mail is acceptable to the recipient) to each of the following: (1) Terence M. Hynes (representing CPRC), Sidley Austin LLP, 1501 K Street, NW., Washington, DC 20005; and (2) William C. Sippel (representing DM&E), Fletcher & Sippel, 29 North Wacker Drive, Suite 920, Chicago, IL 60606.

FOR FURTHER INFORMATION CONTACT: Julia M. Farr, (202) 245–0359. [Assistance for the hearing impaired is available through the Federal Information Relay Service (FIRS) at 1–800–877–8339.]

SUPPLEMENTARY INFORMATION: On November 13, 2007, Applicants filed a petition to establish a revised procedural schedule as directed by the Board in Decision No. 2. The Board now seeks public comments on a procedural schedule that is the same as the Applicants' proposed procedural schedule, except that the record would close with the filing of briefs on July 2, 2008, and that the Board's proposed procedural schedule would provide for a possible oral argument or public hearing to be held on a date in June 2008 to be determined by the Board. Applicants had proposed closing the record on June 16, 2008, with the filing of briefs, and to hold open the possibility of scheduling a public hearing or oral argument after that date. The Board's proposed procedural schedule would instead allow the full 180 days for development of the record,

[20] Under 49 U.S.C. 11325(d)(2), a final decision would be issued by April 25, 2008; however, the Board also is required to accommodate NEPA in its decisionmaking. Therefore, a final decision here will be issued as soon as possible after completion of the EIS process.

[21] The final decision will become effective 30 days after it is served.

[1] In Decision No. 2, the Board found that the transaction contemplated by the Applicants is a significant transaction, as defined at 49 CFR 1180.2(b).

implement a written continuing public education program that follows the guidance provided in the American Petroleum Institute's (API) Recommended Practice (RP) 1162. Upon request, operators must submit their completed programs to PHMSA or, in the case of an intrastate pipeline facility operator, the appropriate State agency. The operator's program documentation and evaluation results must also be available for periodic review by appropriate regulatory agencies. (49 CFR 192.616 and 195.440).

Pursuant to section 3506(c)(2)(A) of the PRA, PHMSA invites comments on whether the renewal of this information collection is necessary for the proper performance of the functions of the Department. These include (1) whether the information will have practical utility; (2) the accuracy of the Department's estimate of the burden of the proposed information collections; (3) ways to enhance the quality, utility, and clarity of the information collection; and (4) ways to minimize the burden of the information collection on respondents, including the use of automated collection techniques or other forms of information technology. As used in this notice, the term ''information collection'' includes all work related to preparing and disseminating information related to this recordkeeping requirement including completing paperwork, gathering information, and conducting telephone calls.

Type of Information Collection Request: Renewal of Existing Collection.

Title of Information Collection: Pipeline Safety: Public Awareness Program.

Respondents: 22,500 (Old).

Estimated Total Annual Burden on Respondents: 517,480 hours. (Old).

Issued in Washington, DC, on January 24, 2008.

Barbara Betsock,

Acting Director, Office of Regulations.

BILLING CODE 4910–60–P

DEPARTMENT OF TRANSPORTATION

Surface Transportation Board

[STB Docket No. AB–6 (Sub-No. 461X)]

BNSF Railway Company—Abandonment Exemption—in Marion County, MO

On January 11, 2008, BNSF Railway Company (BNSF) filed with the Surface Transportation Board a petition under 49 U.S.C. 10502 for exemption from the provisions of 49 U.S.C. 10903 to abandon a 0.56-mile line of railroad extending between milepost 13.86 and milepost 14.42, near Palmyra, in Marion County, MO. The line traverses U.S. Postal Service Zip Code 63461, and it includes no stations.

The line does not contain federally granted rights-of-way. Any documentation in BNSF's possession will be made available promptly to those requesting it.

The interest of railroad employees will be protected by the conditions set forth in *Oregon Short Line R. Co.—Abandonment—Goshen,* 360 I.C.C. 91 (1979).

By issuance of this notice, the Board is instituting an exemption proceeding pursuant to 49 U.S.C. 10502(b). A final decision will be issued by April 30, 2008.

Any offer of financial assistance (OFA) under 49 CFR 1152.27(b)(2) will be due no later than 10 days after service of a decision granting the petition for exemption. Each offer must be accompanied by a $1,300 filing fee. *See* 49 CFR 1002.2(f)(25).

All interested persons should be aware that, following abandonment of rail service and salvage of the line, the line may be suitable for other public use, including interim trail use. Any request for a public use condition under 49 CFR 1152.28 or for trail use/rail banking under 49 CFR 1152.29 will be due no later than February 20, 2008. Each trail use request must be accompanied by a $200 filing fee. *See* 49 CFR 1002.2(f)(27).

All filings in response to this notice must refer to STB Docket No. AB–6 (Sub-No. 461X), and must be sent to: (1) Surface Transportation Board, 395 E Street, SW., Washington, DC 20423–0001, and (2) Sidney L. Strickland, Jr., Sidney Strickland and Associates, PLLC, 3050 K Street, NW., Suite 101, Washington, DC 20007. Replies to BNSF's petition are due on or before February 20, 2008.

Persons seeking further information concerning abandonment procedures may contact the Board's Office of Public Services at (202) 245–0230 or refer to the full abandonment or discontinuance regulations at 49 CFR part 1152. Questions concerning environmental issues may be directed to the Board's Section of Environmental Analysis (SEA) at (202) 245–0305. [Assistance for the hearing impaired is available through the Federal Information Relay Service (FIRS) at 1–800–877–8339.]

An environmental assessment (EA) (or environmental impact statement (EIS), if necessary) prepared by SEA will be served upon all parties of record and upon any agencies or other persons who commented during its preparation. Other interested persons may contact SEA to obtain a copy of the EA (or EIS). EAs in these abandonment proceedings normally will be made available within 60 days of the filing of the petition. The deadline for submission of comments on the EA will generally be within 30 days of its service.

Board decisions and notices are available on our Web site at *http://www.stb.dot.gov.*

Decided: January 23, 2008.

By the Board, David M. Konschnik, Director, Office of Proceedings.

Anne K. Quinlan,

Acting Secretary.

BILLING CODE 4915–01–P

DEPARTMENT OF TRANSPORTATION

Surface Transportation Board

[STB Finance Docket No. 35087]

Canadian National Railway Company and Grand Trunk Corporation—Control—EJ&E West Company; Notice Extending the Public Scoping Period

AGENCY: Surface Transportation Board, Department of Transportation.

ACTION: Notice extending the public scoping period.

SUMMARY: The Surface Transportation Board's Section of Environmental Analysis (SEA) announces the extension of the scoping period for the Environmental Impact Statement (EIS) that is being prepared in connection with an application filed by Canadian National Railroad Company (CN) to acquire certain rail lines of the Elgin, Joliet & Eastern Railroad (EJ&E). SEA is preparing an EIS because the Surface Transportation Board has determined that the proposed acquisition has the potential to result in significant effects upon the environment within the meaning of the National Environmental Policy Act of 1969 (NEPA).

DATES: The scoping period on the EIS is extended through February 15, 2008.

ADDRESSES: If you wish to submit written comments regarding the attached proposed draft scope, please send your comments to: Surface Transportation Board, 395 E Street, SW., Washington, DC 20423. Attention: Phillis Johnson-Ball, Environmental Filing, STB Finance Docket No. 35087.

Environmental comments may also be filed electronically on the Board's Web site, *http://www.stb.dot.gov,* by clicking on the ''E_FILING'' link. You do not

need a Login Account to submit Environmental Comments. Simply click on ''Environmental Comments,'' which will take you to the comment screen. Add the Docket number, which is ''FD 35087.'' Select ''Phillis Johnson-Ball'' in the drop down list under ''attention of.'' Then complete the form by adding your name, address, phone and email, then click ''Submit.''

You may also call your comments into SEA's toll-free hotline established for this proceeding. Dial 1–800–347–0689 and leave your comments after the tone. Please refer to STB Finance Docket No. 35087 in all correspondence, including E-filings, addressed to the Board.

Following these directions will help ensure that your comments are considered in the environmental review process for this proposed acquisition. In addition, SEA will add your name to its mailing list for distribution of the final scope of the EIS, the DEIS, and Final EIS (FEIS).

FOR FURTHER INFORMATION CONTACT: Ms. Phillis Johnson-Ball, SEA Project Manager, toll-free at 1–800–347–0689 (TDD for the hearing impaired 1–800–877–8339). The Web site for the Surface Transportation Board is *http://www.stb.dot.gov.* This document is available in English and Spanish by calling the toll-free number at 1–800–347–0689.

SUPPLEMENTARY INFORMATION: On October 30, 2007, Canadian National Railway Corporation (CN) and Grand Trunk Corporation (GTC), a noncarrier holding company through which CN controls its U.S. rail subsidiaries, filed an application with the Surface Transportation Board (Board) seeking the Board's approval of the acquisition of control of EJ&E West Company (EJ&EW), a wholly owned noncarrier subsidiary of Elgin, Joliet and Eastern Railway Company (EJ&E). In this document, the action before the Board will be referred to as the proposal or the proposed acquisition and CN and GTC will be referred to collectively as CN or as Applicants.

CN is one of Canada's two major railroads, extending from Halifax, Nova Scotia, to Vancouver and Prince Rupert, British Columbia. EJ&E is a Class II railroad that currently operates over 198 miles of track in northeastern Illinois and northwestern Indiana, consisting primarily of an arc around Chicago, IL, extending from Waukegan, IL, southwards to Joliet, IL, then eastward to Gary, IN, and then northwest to South Chicago along Lake Michigan. EJ&E provides rail service to approximately 100 customers, including steel mills, coal utilities, plastics and chemical producers, steel processors, distribution centers, and scrap processors.

Applicants' proposed acquisition of the EJ&E would shift rail traffic currently moving over CN's rail lines inside the EJ&E arc in Chicago to the EJ&E, which traverses the suburbs generally to the west and south of Chicago. Rail traffic on CNR lines inside the EJ&E arc would generally decrease. The decreases in rail traffic would be offset by increases in the number of trains operating on the EJ&E rail line outside of Chicago (approximately 15–27 more trains would operate on various segments of the EJ&E). Applicants also proposed to construct six new rail connections and approximately 19 miles of new sidings/double tracking. Applicants give three primary reasons for seeking approval of the proposed acquisition: Improved rail operations in the Chicago area; availability to EJ&E's Kirk Yard in Gary, Indiana, and other smaller facilities in Joliet, Illinois, and Whiting, Indiana; and improved service to companies dealing in steel, chemicals, and petrochemicals, as well as Chicago area utilities.

Because this proposal has the potential to result in significant environmental impacts, the Board has determined that the preparation of an Environmental Impact Statement (EIS) is appropriate. To help determine the scope of the EIS, and as required by the Board's regulations at 49 CFR 1105.10(a)(2), SEA published in the **Federal Register** and made available to the public on December 21, 2008, the Notice of Availability of Draft Scope of Study for the EIS, Notice of Scoping Meetings, and Request for Comments. SEA held seven public scoping meetings in the project area between on January 9 and 22, 2008. The scoping comment period originally concluded February 1, 2008, but, in response to requests, SEA is extending the scoping period an additional 14 days, to February 15, 2008.

Decided: January 30, 2008.

By the Board, Victoria J. Rutson, Chief, Section of Environmental Analysis.

Anne K. Quinlan,

Acting Secretary.

[FR Doc. E8–1859 Filed 1–30–08; 8:45 am]

BILLING CODE 4915–01–P

DEPARTMENT OF THE TREASURY

Open Meeting of the President's Advisory Council on Financial Literacy

AGENCY: Office of Financial Education, Treasury.

ACTION: Notice of meeting.

SUMMARY: The President's Advisory Council on Financial Literacy (Council) will convene its first meeting on Wednesday, February 13, 2008, in the Cash Room of the Main Department Building, 1500 Pennsylvania Avenue, NW., Washington, DC, beginning at 10 a.m. Eastern Time. The meeting will be open to the public.

DATES: The meeting will be held on Wednesday, February 13, 2008, at 10 a.m. Eastern Time.

ADDRESSES: The President's Advisory Council on Financial Literacy will convene its first meeting in the Cash Room of the Main Department Building, 1500 Pennsylvania Avenue, NW., Washington, DC. The public is invited to submit written statements to the Council. Send written statements in triplicate to the address identified below in the **FOR FURTHER INFORMATION CONTACT** section of this notice. All statements, including attachments and other supporting materials, received are part of the public record and subject to public disclosure. You should submit only information that you wish to make available publicly.

FOR FURTHER INFORMATION CONTACT: Edwin Bodensiek, Director of Outreach, Department of the Treasury, Main Department Building, 1500 Pennsylvania Avenue, NW., Washington, DC 20220; *ed.bodensiek@do.treas.gov.*

SUPPLEMENTARY INFORMATION: By this notice, the Department of the Treasury is announcing that the President's Advisory Council on Financial Literacy will convene its first meeting on Wednesday, February 13, 2008, in the Cash Room in the Main Department Building, 1500 Pennsylvania Avenue, NW., Washington, DC, beginning at 10 a.m. Eastern Time. The meeting will be open to the public. Because the meeting will be held in a secured facility, members of the public who plan to attend the meeting must contact the Office of Financial Education at 202–622–1783 by 5 p.m. Eastern Time on Monday, February 11, 2008, to inform the Department of their desire to attend the meeting and to provide the information that will be required to facilitate entry into the Main Department Building. To enter the building, attendees should provide their full name, date of birth, social security number, organization, and country of citizenship. The purpose of this meeting is to discuss general organizational matters of the President's Advisory Council on Financial Literacy and begin discussing the issues concerning financial literacy.

Dated: April 16, 2008.

By order of the Maritime Administrator.

Christine Gurland,

Acting Secretary, Maritime Administration.

BILLING CODE 4910–81–P

DEPARTMENT OF TRANSPORTATION

Surface Transportation Board

[STB Docket No. AB–33 (Sub-No. 260X)]

Union Pacific Railroad Company—Abandonment Exemption—In Douglas and Sarpy Counties, NE

On April 8, 2008, Union Pacific Railroad Company (UP) filed with the Surface Transportation Board (Board) a petition under 49 U.S.C. 10502 for exemption from the provisions of 49 U.S.C. 10903 to abandon a 3.45-mile portion of its Millard Industrial Lead, extending between milepost 22.85 in Omaha, NE, and milepost 19.4 in La Vista, NE, in Douglas and Sarpy Counties, NE. The line traverses U.S. Postal Service Zip Codes 68128 and 68137 and includes no stations.

The line does not contain any federally granted rights-of-way. Any documentation in UP's possession will be made available promptly to those requesting it.

The interest of railroad employees will be protected by the conditions set forth in *Oregon Short Line R. Co.—Abandonment—Goshen*, 360 I.C.C. 91 (1979).

By issuance of this notice, the Board is instituting an exemption proceeding pursuant to 49 U.S.C. 10502(b). A final decision will be issued by July 25, 2008.

Any offer of financial assistance (OFA) under 49 CFR 1152.27(b)(2) will be due no later than 10 days after service of a decision granting the petition for exemption. Each OFA must be accompanied by a $1,300 filing fee. *See* 49 CFR 1002.2(f)(25).

All interested persons should be aware that, following abandonment of rail service and salvage of the line, the line may be suitable for other public use, including interim trail use. Any request for a public use condition under 49 CFR 1152.28 or for trail use/rail banking under 49 CFR 1152.29 will be due no later than May 19, 2008. Each trail use request must be accompanied by a $200 filing fee. *See* 49 CFR 1002.2(f)(27).

All filings in response to this notice must refer to STB Docket No. AB–33 (Sub-No. 260X), and must be sent to: (1) Surface Transportation Board, 395 E Street, SW., Washington, DC 20423–0001; and (2) Gabriel S. Meyer, Assistant General Attorney, Union Pacific Railroad Company, 1400 Douglas Street, STOP 1580, Omaha, NE 68179. Replies to the UP petition are due on or before May 19, 2008.

Persons seeking further information concerning abandonment procedures may contact the Board's Office of Public Assistance, Governmental Affairs, and Compliance at (202) 245–0230 or refer to the full abandonment or discontinuance regulations at 49 CFR part 1152. Questions concerning environmental issues may be directed to the Board's Section of Environmental Analysis (SEA) at (202) 245–0305. [Assistance for the hearing impaired is available through the Federal Information Relay Service at 1–800–877–8339.]

An environmental assessment (EA) (or an environmental impact statement (EIS), if necessary) prepared by SEA will be served upon all parties of record and upon any agencies or other persons who commented during its preparation. Other interested persons may contact SEA to obtain a copy of the EA (or EIS). EAs in these abandonment proceedings normally will be made available within 60 days of the filing of the petition. The deadline for submission of comments on the EA will generally be within 30 days of its service.

Board decisions and notices are available on our Web site at *http://www.stb.dot.gov*.

Decided: April 17, 2008.

By the Board, David M. Konschnik, Director, Office of Proceedings.

Anne K. Quinlan,

Acting Secretary.

BILLING CODE 4915–01–P

DEPARTMENT OF TRANSPORTATION

Surface Transportation Board

[STB Finance Docket No. 35087]

Canadian National Railway Company and Grand Trunk Corporation Control—EJ&E West Company

AGENCY: Surface Transportation Board, Department of Transportation.

ACTION: Notice of Availability of the Final Scope of Study for the Environmental Impact Statement (EIS).

SUMMARY: On October 30, 2007, the Canadian National Railway Company (CN) and Grand Trunk Corporation (collectively CN or the Applicants) filed an application with the Surface Transportation Board (Board or STB) seeking the Board's approval to acquire control of EJ&E West (EJ&EW) Company, a wholly owned noncarrier subsidiary of the Elgin, Joliet and Eastern Railway Company[1] (EJ&E). In their application, Applicants state that they plan to construct six new rail connections and approximately 19 miles of siding extensions and second mainline track (double track). EJ&E is a Class II railroad that currently operates approximately 200 miles of track in northeastern Illinois and northwestern Indiana.

On November 26, 2007, the Board issued Decision No. 2 announcing that its Section of Environmental Analysis (SEA) will prepare an Environmental Impact Statement (EIS) to assess the potential environmental impacts that may result from the proposed acquisition. On December 21, 2007, SEA published a Notice of Intent (NOI) in the **Federal Register** announcing the start of the scoping process and the dates and times of public scoping meetings. This document, as well as a Draft Scope of Study, was served and distributed to approximately 350 stakeholders and 41 federal, state, and local agencies on an environmental distribution list. A press release was issued to 21 Chicago-area newspapers to announce the NOI to the public.

Information about the STB's environmental review of the proposed acquisition was also made available through the Board's Web site, *http://www.stb.dot.gov.* The Board's Web site provides an overview of the proposed acquisition; public comment guidance; links to documents (including the NOI and Draft Scope of Study); links to CN's, and EJ&E's Web sites; and SEA contact information. Additionally, SEA established a toll-free information line (1–800–347–0689) for public comments with a Spanish-language option available. An electronic filing system is also available on the Board's Web site, *http://www.stb.dot.gov,* to receive comments.

To promote participation in a series of 14 public scoping meetings scheduled for January 2008, SEA placed quarter-

[1] Applicants state in their application that EJ&E plans to transfer all of its land, rail, and related assets located west of the centerline of Buchanan Street in Gary (together with the real property and related fixtures associated with the hump and Dixie leads located east of Buchanan Street) to EJ&EW, which at that time would become a rail common carrier. EJ&E would retain its land, rail, and related assets east of the centerline (other than the real property and related fixtures associated with the hump and Dixie leads). It is expected that, if the proposed transaction is approved and Applicants acquire control of EJ&EW, EJ&E would change its name to Gary Railway Company, and EJ&EW would assume the Elgin, Joliet & Eastern Railway Company name. To eliminate confusion, and because EJ&EW would be a temporary entity, the remainder of this document will refer only to ''EJ&E.''

page advertisements and published public notices in 21 Chicago-area newspapers announcing the meetings. SEA issued a follow-up press release to the same newspapers. Announcement posters were placed in 42 public libraries in communities along the EJ&E rail line, and SEA emailed notices to 285 local elected officials.

Approximately 2,600 individuals participated in the open-house scoping meetings held at seven locations throughout the Chicago region. Two meetings per location were held: One from 1 p.m. to 4 p.m. and one from 6 p.m. to 8 p.m. The dates and locations of the 14 open house meetings were:

- January 8, 2008: Mundelein, Illinois
- January 9, 2008: Barrington, Illinois
- January 10, 2008: Joliet, Illinois
- January 15, 2008: Matteson, Illinois
- January 16, 2008: Gary, Indiana
- January 17, 2008: West Chicago, Illinois
- January 22, 2008: Chicago, Illinois

On January 30, 2008, SEA extended the deadline for Draft Scope of Study comments from February 1, 2008 to February 15, 2008. To publicize the extension, postcards were mailed to 3,038 persons on an updated environmental distribution list, and 43 letters were sent to agencies during the week of January 28, 2008. SEA issued a press release to the 21 Chicago-area newspapers and emailed 310 elected officials to alert them to the comment period extension.

In total, SEA received:

- 1,347 comments from individuals attending the open house meetings;
- 1,268 comment letters;
- 219 oral comments on SEA's information line; and
- 858 individual comments filed electronically on the Board's Web site.

At the conclusion of the comment period, SEA mailed follow-up postcards acknowledging the receipt of comments and participation in the scoping process. SEA placed the names of all commenters on the environmental distribution list, thereby ensuring that they will receive notice of availability of the Draft and Final EIS, as well as the Final Scope of Study.

Based on the comments received and further analysis, SEA has prepared the Final Scope of Study for the EIS, which is included in this Notice of Availability as Appendix A.

Addresses for Further Information

Written requests for further information on the proposed acquisition should be directed to: Phillis Johnson-Ball, Surface Transportation Board, 395 E Street, SW.,Washington, DC 20423–0001.

Telephone requests may be made by calling 1–800–347–0689 (SEA's information line), and emails may be sent via the Board's website at *http://www.stb.dot.gov* by clicking on the ''E_FILING'' link.

SUPPLEMENTARY INFORMATION: On October 30, 2007, Canadian National Railway Company (CN) and Grand Trunk Corporation (GTC), a noncarrier holding company through which CN controls its U.S. rail subsidiaries, filed an application with the Board under 49 U.S.C. 11323–25. The application seeks the Board's authorization for CN to acquire control of the EJ&E rail line, land, and related assets west of Buchanan Street in Gary, Indiana, along with the hump and Dixie lead tracks located east of Buchanan Street leading into Kirk Yard. Trackage east of Buchanan Street would be handled by the Gary Railway Company.

Acquisition of the EJ&E rail line would provide CN with a continuous route around Chicago. The Applicants intend to connect the existing five CN rail lines that run into central Chicago and re-route CN trains now going through Chicago on their way to other destinations, to the EJ&E rail line. The proposed acquisition includes changes in rail line operations and changes in yard operations.

The Applicants plan to make approximately $100 million in capital improvements, including constructing six new connections at Munger, Joliet, and Matteson (all in Illinois) and Griffith, Ivanhoe, and Kirk Yard located in Gary (all in Indiana). In addition, the proposed acquisition includes plans to install double track and extend sidings within the existing EJ&E railroad right-of-way (ROW) along 19 miles of the EJ&E arc at several locations:

- Leithton and Mundelein, Illinois
- East Siding to 95th Street (between Eola and Naperville, Illinois)
- Normantown to Walker, Illinois
- East Joliet to Frankfort, Illinois.

CN has stated that it intends to shift its trains to the EJ&E rail line from the existing CN routes as the proposed new rail line connections are completed and mainline capacity is added to the EJ&E rail line.

The Applicants propose to upgrade and expand Kirk Yard, and to assess the capabilities of the East Joliet Yard and upgrade it to accommodate increased yard activity. The Applicants propose to relocate rail car sorting and train development activities to both Kirk Yard and East Joliet Yard to allow CN to reduce switching activity that now occurs at CN's Glenn, Hawthorne, Schiller Park, and Markham yards, and at the BRC Clearing Yard. The rail cars of local shippers would continue to be handled at all of those locations and intermodal rail cars would still be served at Markham Yard.

Although the Applicants intend eventually to re-route all their trains currently operating over the St. Charles Air Line, a rail line in downtown Chicago owned jointly by CN, Union Pacific Railroad Company (UP), and BNSF Railway Company (BNSF), no abandonments are anticipated as a direct result of the proposed acquisition. Any abandonment of the St. Charles Air Line would require a separate request for authority to the Board under 49 U.S.C. 10903 or 10502, as well as coordination with BNSF and UP, and with other existing users such as Amtrak.

Environmental Review Process: In reviewing the proposed acquisition, the Board will consider both the transportation merits of the proposed acquisition, and the potential environmental impacts. Based on the information provided in the application, concerns raised regarding possible impacts of the proposed acquisition on communities, and consultations with SEA (the office within the Board responsible for preparing the Board's environmental documentation under the National Environmental Policy Act (NEPA), 42 U.S.C. 4321–4335, and related environmental statutes) the Board decided in its decision accepting the application to prepare a full EIS. The EIS will include all of the environmental information necessary for the Board to take the hard look at environmental consequences required by NEPA.

The NEPA environmental review process is intended to assist the Board and the public to identify and assess potential environmental consequences of the proposed acquisition before a decision is made whether to approve the proposed transaction, deny it, or approve it with mitigating conditions, including environmental conditions. On December 21, 2007, SEA issued a Notice of Intent (NOI) to individuals and agencies potentially interested in or affected by the proposed acquisition informing them of the Board's decision to prepare an EIS and to initiate the formal scoping process.

SEA also developed and made available a Draft Scope of Study and requested comments. Public meetings were held and comments were received between December 21, 2007 and February 15, 2008. After carefully reviewing the public comments, SEA is issuing this Final Scope of Study for the Draft EIS.

SEA is currently preparing a Draft EIS for the proposed acquisition. The Draft EIS will address those environmental issues and concerns identified during the scoping process and detailed in this Final Scope of Study. It will also include an appropriate discussion of alternatives and potential environmental mitigation.

Upon its completion, the Draft EIS will be made available for public and agency review and comment. A Final EIS will then be issued reflecting the SEA's further analysis, the comments on the Draft EIS, and SEA's recommendations (if any) for environmental mitigation. In reaching its decision on this case, the Board will take into account the full environmental record, including the Draft and Final EIS, and all public and agency comments received.

Discussion

Many issues that emerged through the scoping process are linked to concerns about potential impacts from increased freight rail traffic as a result of this proposed transaction. The issues raised by commenters are briefly outlined below, followed by a discussion of how the issue will be addressed in the Draft EIS. This preamble to the actual Final Scope of Study, included in Appendix A, provides SEA's rationale.

Proposed Acquisition and Definition of Alternatives

Reasonable and feasible alternatives for the proposed acquisition that will be evaluated in the EIS include approval of the transaction as proposed, disapproval of the proposed transaction in whole (No-Action alternative), or approval of the proposed transaction with conditions, including environmental mitigation conditions.[2]

Many commenters recommended that the EIS include consideration of the Chicago Region Environmental and Transportation Efficiency Program (CREATE Program) as an alternative to the proposed acquisition, or that it at least consider the effects on CREATE, and the use of non-EJ&E rail corridors and connections for CN to move its trains through the Chicago area.

[2] The Board has broad authority to impose conditions in railroad control transactions under 49 U.S.C. 11324(c). However, the Board's power to impose conditions is not limitless: There must be a sufficient nexus between the condition imposed and the transaction before the agency, mitigation is not imposed to correct pre-existing conditions, and the condition imposed must be reasonable. See *United States* v. *Chesapeake & O. Ry.,* 426 U.S. 500, 514–15 (1976); *Consolidated Rail Corp.* v. *ICC,* 29 F.3d 706, 714 (D.C. Cir. 1994).

CREATE and Other Non-EJ&E Rail Corridors as Alternatives

NEPA and the Board's environmental rules require the EIS to include reasonable and feasible alternatives to the proposed acquisition (49 CFR 1105.7(e)(1)). The EIS will evaluate proposed alternatives to determine which would meet ''the purpose and need'' of the proposed transaction, and warrant actual study or analysis, for the reasons that will be explained in the EIS. The purposes of the proposed transaction are described in a section of the CN application entitled ''Purpose of the Transaction'' (p. 22). These purposes are (1) connecting the five CN rail lines in the Chicago area to create operational improvements throughout the CN system, (2) obtaining access to the East Joliet and Kirk Yards, and (3) facilitating expanded business opportunities with EJ&E's shippers. Any reasonable and feasible alternative must meet the stated purpose and need for the proposed acquisition.

Neither CREATE nor any other non-EJ&E rail corridors will be treated as alternatives for the proposed action because they plainly would not meet the three-fold purpose and need articulated in the application. Nevertheless, the transportation systems section of the EIS will address these issues as appropriate.

Alternative Connections

Commenters also suggested that the EIS should examine alternative locations or configurations for the proposed new connections to reduce potential impacts related to this proposed transaction because there may be a variety of reasonable ways in which Applicants could accomplish construction of the proposed connections. The EIS will contain an appropriate examination of alternative configurations for the proposed connections to determine whether there is a way to meet the purpose and need of the proposed acquisition with less potential environmental impact.

Environmental Impact Categories

Safety

Commenters raised concerns about rail safety and security, the Applicants' emergency management capability and planning, and the proximity of sensitive populations and land uses to the EJ&E rail line. The largest number of commenters on safety issues expressed concern about the potential impacts to local communities from accidents. As indicated in the Draft Scope of Study, the EIS will evaluate the effects of the proposed acquisition on the safety of the public at large (including such issues as increased probability of train accidents and derailments due to increased proposed acquisition-related train traffic on a system-wide basis), potential effects at grade crossings, and potential effects of increased proposed transaction-related freight traffic on commuter and intercity passenger service operations. The EIS also will include an appropriate discussion of Applicants' Safety Integration Plan.

Hazardous Materials Transportation

A number of commenters requested that the EIS address potential environmental impacts of the proposed acquisition on public health and safety with respect to the transportation of hazardous materials, including a discussion of possible accidental release, spill management capability, and the presence of contaminated sites. Many commenters suggested that this analysis should include CN's safety record in Canada, as well as the United States. Other commenters suggested that the EIS should assess accidents involving hazardous materials and alternative routes for hazardous material shipments.

The EIS will assess CN's safety record in the United States. The rail safety statistics in Canada are collected and analyzed in a different manner than that used in the United States. The EIS will provide information on CN's U.S. safety record and that of the other U.S. Class I railroads, as compiled by the Association of American Railroads (AAR), to provide a valid basis for comparison. The EIS will use Federal Railroad Administration (FRA) standards as the basis for compliance for all hazardous material accidents and spills. The EIS also will address quantities and types of hazardous materials transported, response plans for potential spills or accidents, and locations of contaminated sites in the vicinity of planned construction activities.

Transportation Systems

There are approximately 140 highway/rail at-grade crossings on the EJ&E line that may experience longer traffic delays due to increased freight rail traffic resulting from the proposed acquisition. Although existing CN crossings on lines into downtown Chicago would experience less train traffic and fewer delays as a result of the proposed acquisition, a number of commenters expressed concern about the potential impact of increased freight rail traffic on local transportation systems, including congestion and delays at highway/rail at-grade crossings, and potential impacts to

community emergency response capability.

Consistent with the Draft Scope of Study, the EIS will evaluate the impact of the proposed transaction on local transportation systems and intercity Amtrak services, vehicular delays due to increases in rail-related operation, and increased train traffic on movable railroad bridges as a result of the proposed transaction. Since no changes in intermodal activity or truck traffic have been identified, analysis of truck traffic as identified in the Draft Scope of Study does not appear warranted. Other issues of concern to be included in the transportation systems impact evaluation are described below.

Planning Horizon: CN has used 2012, three years from the date of the Board's anticipated issuance of a final decision, as the year it expects to achieve the rail traffic projected in the application. Many commenters objected that this three-year forecasting period is too short. Commenters are concerned that using 2012 as the planning horizon would underestimate the potential effects of the proposed acquisition, and could result in less mitigation than the mitigation the Board would impose if the planning horizon were lengthened.

Planning horizon threshold suggestions for both freight rail and highway traffic ranged from 2020 to as long as 2030 or 2035. The commenters believe that potential increases in freight rail traffic can be projected that far into the future, even though the forecasts are not as reliable as shorter projections. The commenters also allege that CN would not have decided to proceed with this proposed acquisition transaction based only on a short range forecast of potential freight rail traffic. On the other hand, CN contends that forecasts longer than three to five years are necessarily speculative due to uncertainties in the global economy and the effects of competition. CN also states that the proposed transaction would not lead to additional freight rail traffic beyond the projections in the application.

After carefully considering the comments, SEA has determined that the time horizons suggested by the commenters are too long to produce reliable information. Those time horizons also exceed by far the time horizons that have been used in prior Board proceedings. At the same time, the three-year time horizon proposed in the Draft Scope of Study is too short for the proposed transaction. Thus, the EIS will use a five-year threshold from the date of the anticipated year of the issuance of a final decision (2015) for analysis of effects of increased rail traffic, such as vehicle delay. This year was selected because five years is not too long to produce reasonable and reliable freight rail forecasts. SEA has requested the necessary information from CN to permit the use of a five-year forecast in the EIS.

Highway traffic will also be forecasted to 2020 for vehicle delay analysis. The year 2020 is reasonable based on available highway traffic data and will provide useful information for community planning purposes. Any year further in the future would diverge too much from the five-year freight rail forecast timeframe that will be used.

ADT Threshold: The Draft Scope of Study stated that the EIS would assess impacts to safety and vehicle delays at highway/rail at-grade crossings where the average daily highway traffic (ADT) exceeds 2,500 vehicles per day, but did not state which year should be used to measure the ADT. Some commenters suggested that the threshold for analysis should be lowered to 2,000 vehicles per day, to better help interested persons obtain information on all of the possible locations where drivers could be delayed or safety could be affected as a result of this proposed transaction.

In the EIS, vehicle delay will be estimated for all public highway/rail at-grade crossings and more detailed analysis will be done for crossings with an ADT of 2,500 vehicles per day. To clarify, SEA will apply the 2,500 vehicle per day threshold to traffic levels for the years 2015 and 2020. SEA also will conduct a more detailed analysis where the ADT at the crossing is less than 2,500 vehicles per day where appropriate as a result of specific circumstances. The ADT threshold of 2,500 vehicles per day will provide a sufficient level of analysis to determine the location of significant effects of the proposed acquisition on safety or vehicle traffic delays.

Gary Chicago International Airport (GCIA): Many commenters took the position that the EIS should analyze the effects of the proposed transaction on the Gary Chicago International Airport (GCIA). The GCIA has been engaged in an improvement program to increase the capacity of its existing principal east/west runway and to remedy a safety deficiency associated with this runway. Supporters of the airport expansion expect it to provide economic stimulus to the economy of Northwest Indiana. The Federal Aviation Administration (FAA) signed a Record of Decision (ROD) approving the extension in 2005.

According to the comments, GCIA plans to extend the primary runway (designated as Runway 12/30) 1,900 feet to the northwest to solve capacity and safety problems. Based on the available information, GCIA evidently has obtained commitments for funding to carry out airport improvements. Currently the northwest end of the runway is only 270 feet from the EJ&E tracks, which are on top of an embankment that places the tracks 22 feet above the end of the runway. Safety concerns have been raised because of the proximity of the EJ&E roadbed to the end of the runway, and the roadbed's elevation above the runway.

To extend the runway and reduce the potential safety issues, GCIA has proposed to relocate and lower to ground level the EJ&E tracks. According to the FAA ROD, the proposed relocation of the EJ&E would increase the rail route by 5,263 feet and add two highway/rail at-grade crossings at Chicago Avenue and Industrial Drive. These two crossings would be eliminated at a later date by closing Chicago Avenue and raising the grade of Industrial Highway over the EJ&E tracks.

Negotiations have been ongoing for many years between GCIA and EJ&E. CN has been sitting in on negotiations since the proposed acquisition was announced. To date, the parties have not reached an agreement on whether to relocate the EJ&E line or how the rail line relocation should be designed. During the parties' negotiations, concerns have been raised about increased fuel consumption and interference of the highway/rail at-grade crossings with train operations if the rail line is relocated. GCIA has contended that projected additional trains associated with the proposed transaction could make it more difficult to negotiate a solution to the runway problem. In response, CN asserts that the proposed transaction would have no effect on the relocation negotiations or GCIA because CN believes that the number of trains using the EJ&E rail line does not affect the issues that need to be addressed related to the relocation. CN has labeled the potential impacts of the proposed line relocation ''a pre-existing condition,'' rather than one that would be a direct result of the proposed acquisition transaction.

The Draft Scope of Study did not mention any analysis of potential effects on existing or proposed airports. Based on the comments, SEA will include in the EIS an appropriate analysis of the impacts of increased train traffic on the existing line near GCIA, as well as the proposed runway expansion and rail line relocation at GCIA.

The Commuter Rail Division of the Regional Transportation Authority (Metra) and the Suburban Transit Access Route (STAR Line): Many

individuals and government agencies commented that the EIS should address the effects of the proposed transaction on future commuter rail service planned for a portion of the EJ&E ROW in Illinois. The Commuter Rail Division of the Regional Transportation Authority (a/k/a Metra) proposes to institute passenger service on certain segments of the EJ&E ROW and tracks. The service, to be known as the Suburban Transit Access Route, or the STAR Line, is part of the 2030 Regional Transportation Plan for Northeastern Illinois. The STAR Line plan calls for service over approximately 35 miles of EJ&E ROW from a point east of Interstate 55 in Joliet, to Interstate 90 in Hoffman Estates, from which the service would then travel eastward on new track within the I–90 ROW corridor to O'Hare Airport. Metra's STAR Line would include seven new passenger rail stations along the existing EJ&E rail line in Cook, DuPage, and Will counties.

Congress authorized funding for preliminary engineering of the STAR Line in Section 3043(c)(120) of SAFETEA–LU. Many of the municipalities along the STAR Line route have already obligated or spent funds to provide new passenger rail stations and are incorporating the STAR Line into their land use planning. Metra is also studying potential extensions to the STAR Line east of Joliet and north of Hoffman Estates on the EJ&E ROW, but that planning is preliminary and is not expected to be completed in the foreseeable future.

The Draft Scope of Study states that the transportation systems analysis in the EIS will address the potential effects on reasonably foreseeable future commuter rail operations. SEA now clarifies that the EIS will encompass an appropriate discussion of the STAR Line from Joliet to Hoffman Estates, as part of the analysis.

Metra and the EJ&E Interlockings: Many commenters urged that the EIS should include an analysis of the effects of the proposed acquisition on commuter rail operations where the Metra trains intersect with the EJ&E. Metra currently operates approximately 700 trains each day throughout the Chicago region. The Metra trains pass over ''interlockings'' (rail to rail at-grade crossings) where freight traffic on the EJ&E corridor is projected to increase as a result of the proposed transaction. The interlockings are controlled by EJ&E. Metra and many other commenters are concerned that the projected freight increases resulting from this proposed transaction could impair Metra's on-time performance by causing commuter trains to wait for passing or stopped freight trains. Metra further states that it is planning to extend its service on the UP West Line that passes over the EJ&E interlocking at West Chicago, and on the UP Northwest Line that passes over the EJ&E interlocking at Barrington. Metra is also planning to institute new Southeast Service over the UP ROW, which would pass over the EJ&E interlocking at Chicago Heights. The success of these projects allegedly would be adversely affected due to the projected freight rail increases described in the application.

The Metra extensions described above are part of the 2030 Regional Transportation Plan for Northeastern Illinois. Section 3043(a)(13) of SAFETEA–LU authorized over $26 million for final design and construction of Metra's UP West Extension. Section 3043(c)(119) of SAFETEA–LU authorized funding of preliminary engineering for Metra's Southeast Service.

As the Draft Scope of Study stated, the EIS will evaluate the effects of the proposed transaction on existing and reasonably foreseeable commuter rail operations. As part of that analysis, the EIS will contain an appropriate examination of the transportation system impacts of the proposed acquisition on existing Metra service, Metra's UP West Extension, the UP Northwest Extension, and the Southeast Service.

The National Railroad Passenger Corporation (AMTRAK): Many commenters noted that the EIS should consider the effects of the proposed transaction on AMTRAK service between downstate Illinois and Chicago. AMTRAK explained that it operates six trains each day over the CN Chicago Subdivision Line south from a point near 23rd Street on Chicago's Lakefront Line. These six trains connect from the Lakefront Line to Chicago's Union Station over the St. Charles Air Line, a rail line owned jointly by CN, UP, and BNSF. Under the proposed transaction, CN would no longer operate any freight trains over the St. Charles Air Line or along the Lakefront Line. AMTRAK is concerned that it could remain the only user of the St. Charles Air Line and CN's Lakefront Line and, as such, could be required to pay all maintenance expenses for the St. Charles Air Line. The Illinois Department of Transportation (IDOT) shares AMTRAK's concern, noting that it helps to finance AMTRAK's six daily trains. AMTRAK and IDOT say they would not be able to pay all of the maintenance expenses alone, which could jeopardize AMTRAK's current service. AMTRAK further indicates that, at present, it does not have an acceptable alternative access route into Chicago's Union Station.

The commenters also asked that the EIS assess the impacts that could occur from loss of AMTRAK service to Illinois communities that rely on AMTRAK service to and from Chicago and the effects on the highway system and related energy consumption that would result from loss of this service.

CN minimizes the potential impacts of this proposed transaction on AMTRAK, noting that AMTRAK has an existing agreement to use the St. Charles Air Line and the Lakefront Line tracks through 2010 and that AMTRAK can continue to use these lines indefinitely on the same terms with the same adjustments for inflation, as stated in the existing agreement. CN adds that there is no proposal pending before the Board to abandon the St. Charles Air Line or any of CN's tracks along the Chicago Lakefront Line.

The Draft Scope of Study stated that the EIS would describe the effects of the proposed acquisition on existing AMTRAK service. SEA now clarifies that the EIS will examine the transportation system impacts on existing AMTRAK service on the St. Charles Air Line and the other CN lines used by AMTRAK in the Chicago area. Because there is no proposal in front of the Board for authority to abandon the St. Charles Air Line, the possible future discontinuance of AMTRAK service over the St. Charles Air Line will not be analyzed in detail in the EIS. Any attempt to do so at this point would be speculative.

Northern Indiana Commuter Transportation District (NICTD): Many commenters urged that the EIS consider the effects of the proposed transaction on existing and proposed commuter rail service for Northwestern Indiana. The commenters explain that NICTD operates the South Shore commuter rail service between South Bend, Indiana and Chicago. The South Shore connects with the CN Illinois Central (Chicago Subdivision) tracks at 115th and Kensington in Chicago. Freight service on this CN line is expected to decrease as a result of the proposed transaction. NICTD is presently completing a switching improvement project where its tracks connect with CN at 115th and Kensington. NICTD evidently is considering two new West Lake Corridor commuter rail services between Chicago and communities in northwest Indiana. Both proposed services apparently would use existing Metra and NICTD trackage to Hammond, where the services would then use ROW controlled by NICTD south to Maynard, near Munster.

Service between Chicago and Valparaiso, Indiana would use the CN South Bend Subdivision between Munster and Valparaiso, Indiana; this service would cross the EJ&E at Griffith. Service between Chicago and Lowell, Indiana would use CSXT trackage between Munster and Lowell, Indiana. This service would cross the CN South Bend Subdivision at Maynard and the EJ&E at Dyer.

The available information indicates that NICTD has prepared two planning documents related to these proposed services, which identify the purpose and need for the proposed services and describe rail and bus alternatives. However, a Locally Preferred Alternative (LPA) has not been determined for these services. No funding sources have been secured to date for continued planning and implementation for the proposed services. NICTD also does not have an agreement with CN to use its South Bend Subdivision ROW for the proposed passenger service. NICTD and others have commented that the outstanding issues related to use of the CN South Bend Subdivision ROW should be resolved in the instant acquisition proceeding and that the EIS should assess the impacts related to loss of the opportunity to institute new commuter service on the CN South Bend Subdivision ROW.

An appropriate discussion of the NICTD operations will be included in the EIS.

Land Use

Some commenters expressed concerns regarding potential impacts to parks and other community facilities and amenities, as well as impacts to neighborhoods including visual impacts. Consistent with the Draft Scope of Study, the EIS will evaluate consistency of the proposed transaction with existing land use plans and zoning requirements, and potential impacts to prime farmland. Because trains already operate on the EJ&E rail line, and additional trains resulting from the proposed transaction are not expected to change the physical character of the line or adjoining lands, SEA does not believe that a detailed visual impact analysis is warranted.

Socioeconomics

A number of commenters expressed concern over the potential impacts that the proposed acquisition would have on community quality of life, on local property values and the local economy, and how the proposed transaction would affect community growth and social cohesion. Consistent with the Draft Scope of Study, the EIS will evaluate socioeconomic issues related to changes in the physical environment as a result of the proposed transaction.

Energy

Some commenters expressed concern about fuel consumption related to congestion and potential effects of the proposed transaction on climate change. As indicated in the Draft Scope of Study, the EIS will evaluate the potential environmental impact of the proposed transaction on the transportation of energy resources and recyclable commodities to the extent that such information is available, and evaluate potential changes in fuel use arising from the proposed transaction. The EIS will also include an appropriate discussion of fuel use changes related to this proposed transaction and climate change.

Air Quality

Commenters expressed concern regarding the potential impacts of the proposed transaction to public health and regional air quality resulting from proposed transaction-related changes in train emissions. The commenters noted that longer and more frequent trains and additional rail activity in the rail yards are expected to increase air emissions in the EJ&E corridor. In addition, commenters were concerned about an increase of emissions at highway/rail at-grade crossings from vehicles subject to delays as a result of the proposed acquisition. The Chicago Metropolitan Area has been designated as a nonattainment area under the Clean Air Act. Accordingly, the EIS will evaluate air emissions increases where the post-proposed acquisition activity would exceed the Board's thresholds for environmental review in nonattainment areas in 49 CFR 1105.7(e)(5)(i) (generally, an increase of three trains per day on any segment of rail line affected by the proposal).

The EIS will also evaluate the net increase in emissions from increased railroad operations, as well as potential air emissions increases from vehicle delays at rail crossings associated with the proposed transaction. Emissions changes arising from the proposed transaction will be estimated, including expected increases or decreases in diesel particulate emissions and related air toxics.

Noise and Vibration

Many commenters expressed concern about potential increases in horn and other noise, as well as train-induced vibration throughout the EJ&E corridor as a result of the proposed acquisition. As the commenters note, the proposed transaction would place more and longer trains on EJ&E tracks and increase activity at key points such as Kirk Yard in Gary, Indiana. Accordingly, consistent with the Draft Scope of Study, the EIS will evaluate potential proposed transaction-related increases in noise and associated impacts and will assess potential vibration effects based on Federal Transit Administration (FTA) vibration methodology in areas where it appears there may be vibration sensitive receptors within or adjacent to the EJ&E rail line ROW.

Biological Resources

Commenters expressed concern regarding potential impacts of the proposed transaction on wildlife, as well as nature preserves and designated natural areas. The Draft Scope of Study stated that the EIS would assess the effects of acquisition-related construction (double tracking, proposed new connections) on threatened and endangered species, wildlife sanctuaries or refuges, and national or state parks or forests. Many commenters suggested that the EIS should also assess the effects of increased rail operations, maintenance (herbicide spraying), and the risk of accidents on wildlife areas along the EJ&E ROW.

Based on the comments, the EIS will assess the operational impacts of additional freight rail traffic on areas where federal or state threatened or endangered species or designated critical habitats are located. The EIS will examine the effects of the proposed acquisition in areas along the EJ&E rail line ROW that have been designated as natural areas by federal, state, and local natural resource agencies. The EIS will also assess the potential effects on designated natural areas from construction of the alternative configurations for the proposed new connections and double tracking.

Water Resources

Some commenters expressed concern about the potential effects of the proposed transaction on surface and groundwater quality, as well as flood plains and local drainage systems. As indicated in the Draft Scope of Study, the EIS will evaluate consistency with applicable federal or state water quality standards; determine if permits may be required under Sections 404 or 402 of the Clean Water Act (33 U.S.C. 1344) for any proposed construction; and assess whether any planned construction has the potential to encroach upon any designated wetlands or 100-year floodplains.

Environmental Justice

Some commenters expressed concern about potential disproportionate adverse effects of the proposed acquisition on minority or low income populations. Consistent with the Draft Scope of Study, the localized adverse impacts of the proposed transaction (for example, noise, air quality, residential or business relocations, and community impacts) will be analyzed in relation to the presence of minority and low income populations. The EIS will assess demographics in the immediate vicinity of areas where major planned activities (such as construction of improved rail connections, siding extensions, and installation of double track) would take place, and where increases in train traffic would be above the Board's threshold for environmental review. The EIS will evaluate whether such activities potentially could have a disproportionately high and adverse effect on minority or low income groups.

Cultural and Historic Resources

The Draft Scope of Study stated that the EIS would address potential effects from construction of the proposed connections and double tracking on cultural and historic resources that are in or immediately adjacent to the railroad ROW. Commenters suggested that the EIS should assess impacts on cultural resources that are near but not necessarily adjacent to the EJ&E ROW or near the area where new connections are proposed. These cultural resources range from historic and prehistoric sites to historic districts.

The Final Scope of Study clarifies that the EIS will establish an area of potential effect (APE) in coordination with the State Historic Preservation offices (SHPO) in Illinois and Indiana. SEA will assess potential effects within the APE. The APE will most likely be inside the EJ&E ROW and the immediate area where construction activities (double tracking, new connections) may cause ground disturbance. In addition, the EIS will evaluate Native American sites to the extent they are suggested for evaluation by a SHPO or a Native American tribe.

Indirect and Cumulative Effects

Commenters expressed concern about the potential indirect and cumulative effects that could be caused by the proposed acquisition, including effects of other reasonably foreseeable activities on communities and natural resources. Consistent with the Draft Scope of Study, the EIS will address indirect and cumulative effects that may occur later in time, or at other locations, or which, in combination with other actions, could affect the same resources. This analysis will be done for reasonably foreseeable related actions that warrant such analysis, given the context and scope of the proposed acquisition.

In addition, some commenters suggested that the EIS should examine the effects of increased freight rail traffic on CN lines in Wisconsin. They suggested that the proposed acquisition of the EJ&E by CN would result in increased traffic on the CN lines in Wisconsin going to and from the Chicago area. This, the commenters state, would result in increased impacts to safety and air quality in Wisconsin.

In preparing the EIS, SEA will determine the geographic boundaries for the analysis of indirect and cumulative effects by examining an area within reasonable proximity to the area or areas where direct effects to environmental resources are observed. SEA will also take into account the nature of each affected resource that is analyzed. The Applicants have not identified proposed transaction-related train traffic changes on any of the CN rail line segments outside of the EJ&E's arc. Although SEA's own review analysis has not been completed yet, the available information does not suggest that an analysis of indirect and cumulative effects outside of the Chicago metropolitan area will be warranted.

As indicated in the Draft Scope of Study, the EIS will evaluate indirect and cumulative effects, as appropriate, for other projects or activities that relate to the proposed transaction where SEA determines that there is the likelihood of significant environmental impacts and where information is provided to the Board that describes (1) those other projects or activities, (2) their interrelationship with the proposed acquisition, and (3) the type and severity of the potential environmental impacts. This information must be provided to the Board within sufficient time to allow for review and analysis in the EIS.

Some commenters suggested that the EIS should examine the effects of the proposed acquisition of the Dakota, Minnesota & Eastern Railroad Corporation (DM&E) and the Iowa, Chicago & Eastern Railroad Corporation (IC&E) by Canadian Pacific Railway Corporation (CP).[3] Prior to CP's application to acquire DM&E and IC&E, the Board approved an extension of the DM&E into the Powder River Basin in Northeastern Wyoming to permit rail access to coal resources.[4] The commenters believe that the likely route for any new coal shipments that could result from the CP's proposed acquisition of the DM&E would be over the CN rail lines in Wisconsin, including the EJ&E rail lines, if CN's proposed acquisition of EJ&E is authorized and implemented. They contend that this would result in more and longer freight trains than the numbers projected in the application, which, the commenters claim, would result in more severe impacts on their communities than would otherwise be the case.

As previously noted, the EIS will include an appropriate evaluation of indirect and cumulative effects of reasonably foreseeable projects that relate to the proposed acquisition. The commenters' suggestion that the impacts of the proposed acquisition of the DM&E and IC&E by CP need to be considered as part of the cumulative impact analyses, however, is premature. In a decision in Finance Docket No. 35081, issued on April 4, 2008, the Board determined that it would be appropriate to defer preparation of an EIS addressing the possible future movement of DM&E PRB coal traffic over the IC&E and/or CP lines because sufficient information is not available to conduct a meaningful review now. In that decision, the Board made clear that should it ultimately authorize the transaction proposed in Finance Docket No. 35081, it would impose conditions on the authorization precluding such movements pending completion of an EIS and the issuance of a final Board decision addressing the impact of such coal operations and allowing such operations to begin, if appropriate. In short, no movements of the sort commenters are concerned about are reasonably foreseeable at this time.

Mitigation

Many commenters suggested that the Board should require CN to install highway/rail grade separations or change rail operations wherever vehicle delays or safety risk would exceed the existing conditions. Other commenters stated that the Board should base its mitigation conditions on the accomplishment of regional goals and not on local problem sites. Some commenters believed that the Board should retain jurisdiction over the

[3] This acquisition is pending before the Board in STB Finance Docket No. 35081, *CP Railway Company et al.—Control—Dakota Minnesota & Eastern Railroad Corp., et. al.*

[4] See *Dakota, Minnesota & Eastern Railroad Corp., Construction into the Powder River Basin*, STB Finance Docket No. 33407 (STB served Feb. 15, 2006), affirmed *Mayo Foundation* v. *STB*, 472 F.3d 545 (8th Cir. 2006).

proposed transaction for an extensive period after the proposed transaction is implemented (assuming the Board authorizes it), to review additional increases in freight rail and vehicle traffic to determine appropriate mitigation. Other commenters suggested that the Board should not approve the proposed transaction unless CN agrees to make accommodations for improvements, such as the runway extension at GCIA and the NICTD West Lake Corridor service on the South Bend Subdivision ROW.

It would be inappropriate to present any specific mitigation in the Final Scope of Study for the Draft EIS. Mitigation depends on the results of the environmental analysis, and the environmental analysis related to the proposed transaction is not yet completed. The Draft EIS will contain recommendations for environmental mitigation based on the results of the analysis of potential effects. After the Draft EIS is issued, commenters will have the opportunity to comment on the mitigation recommendations in the Draft EIS. The comments will be reflected in the Final EIS. The Board then will consider SEA's final recommended mitigation in deciding whether to grant or deny the proposed acquisition or grant it with environmental conditions. Finally, it is worth noting here that the Board only has authority to require mitigation for effects arising from the proposed acquisition, not pre-existing conditions. At the same time, however, voluntary mitigation (i.e., mitigation proposed by the railroad often after consultations with potentially affected communities and others) can sometimes achieve more far reaching results than the Board could unilaterally impose. Voluntary mitigation and mutually acceptable negotiated agreements can result in cost sharing to allow completion of very costly measures, such as grade-separated crossings, which primarily benefit the community rather than the railroad, and thus are typically funded primarily by entities other than the railroad.

The Final Scope of Study for the Draft EIS of the proposed transaction is attached as Appendix A.

By the Board, Victoria J. Rutson, Chief, Section of Environmental Analysis.

Anne K. Quinlan,

Acting Secretary.

Appendix A: Final Scope of Study for the EIS

Proposed Action and Definition of Alternatives

Applicants' proposed acquisition of the EJ&E railroad would result in shifting of rail traffic from rail lines in Chicago to rail lines on the EJ&E line, which forms an arc around Chicago. Rail traffic on CN lines inside the EJ&E arc would generally decrease. These decreases in rail traffic would be offset by substantial increases in the number of trains operated on the EJ&E line outside Chicago. The increase in train traffic on the EJ&E line would vary from approximately 15 to 24 additional trains per day. Applicants state that the proposed transaction would not impair CN's ability to handle commuter trains, passenger trains, or trackage/haulage trains currently operating on the EJ&E line. Finally, on the integrated CN/EJ&E system, four train pairs would be added to EJ&E terminals: three inbound and three outbound switch trains at Kirk Yard, and one inbound and one outbound switch train at East Joliet Yard. Applicants' projections for the changes in rail operations as a result of the proposed acquisition are set forth in the application, available on the Board's Web site. The proposed transaction also includes construction of six rail connections, siding extensions, and installation of double track. The EIS will discuss the purpose and need for the proposed transaction.

Reasonable and feasible alternatives for the proposed acquisition that will be evaluated in the EIS are (1) approval of the proposed transaction, (2) disapproval of the proposed transaction in whole (No-Action alternative), or (3) approval of the proposed transaction with conditions, including environmental mitigation conditions.[5]

In addition, the EIS will consider as appropriate, reasonable and feasible alignment alternatives for the six proposed connections.

[5] The Board has broad authority to impose conditions in railroad acquisition transactions under 49 U.S.C. 11324 (c). However, the Board's power to impose conditions is not limitless: there must be a sufficient nexus between the condition imposed and the transaction before the agency, mitigation is not imposed to remedy pre-existing conditions, and the condition imposed must be reasonable. See *United States* v. *Chesapeake & O. Ry.*, 426 U.S. 500, 514–15 (1976); *Consolidated Rail Corp.* v. *ICC*, 29 F.3d 706, 714 (D.C. Cir. 1994).

Environmental Impact Analysis

Analysis in the EIS will address proposed activities and their potential environmental impacts, as appropriate. Existing rail operations are the baseline from which the potential environmental impacts of the proposed transaction will be evaluated. SEA will evaluate only the potential environmental impacts of operational and physical changes that are directly related to the proposed transaction. SEA will not consider environmental impacts solely arising from existing rail operations and existing railroad facilities.[6]

The scope of the analysis will include the following types of activities:

1. Anticipated changes in level of operations on rail lines (for instance, an increase in average length of trains, or a proposed change in average train speed) for those rail line segments that meet or exceed the Board's thresholds for environmental review in 49 CFR 1105.7.

2. Proposed changes in activity at rail yards to the extent such changes may exceed the Board's thresholds for environmental analysis in 49 CFR 1105.7

3. Proposed physical construction of improved rail connections, siding extensions, and installation of double track.

Environmental Impact Categories

The EIS will address potential impacts on the environment that will include the areas of safety, rail operations, transportation systems, hazardous waste sites, hazardous materials transportation, land use, energy, air quality, noise, natural resources, water resources, socioeconomic effects related to physical changes in the environment, environmental justice, cultural or historic resources, and indirect and cumulative effects, as described below.

1. Safety

The EIS will:

A. Consider at-grade rail crossing accident probability and safety factors related to increased freight traffic as a result of the proposed transaction. This will generally include all public highway/rail at-grade crossings.

[6] 6 In proceedings similar to this proposed acquisition, the Board's practice consistently has been to mitigate only those environmental impacts that result directly from the proposed transaction. The Board, like its predecessor, the Interstate Commerce Commission, has not imposed mitigation to remedy pre-existing conditions such as those that might make the quality of life in a particular community better, but are not a direct result of the proposed acquisition (i.e., congestion associated with the existing rail line traffic, or the traffic of other railroads).

Accident probability analysis will address the potential for rail and vehicle accidents.

B. Consider increased probability of train accidents and derailments due to increased proposed transaction-related traffic on a system-wide basis.

C. Address potential effects of proposed transaction-related increased freight traffic on commuter and intercity passenger service operations.

D. Discuss CN's emergency management or emergency response plans.

E. Address safety issues associated with the integration of differing rail operating systems and procedures, including an appropriate discussion of Applicants' Safety Integration Plan.

2. Hazardous Materials Transportation

The EIS will discuss the potential environmental impacts of the proposed transaction on public health and safety with respect to the transportation of hazardous materials, including:

A. Changes in the types of hazardous materials and quantities transported or re-routed.

B. Nature of the hazardous materials that are currently being transported or are proposed to be transported.

C. Applicants' safety practices and protocols.

D. Applicants' U.S. safety data on derailments, accidents and hazardous materials spills.

E. Contingency plans to address accidental spills.

F. Probability of increased spills given railroad safety statistics and applicable Federal Railroad Administration requirements.

3. Transportation Systems

The EIS will:

A. Describe system-wide and localized effects of the proposed transaction-related operational changes, construction of proposed connections, siding extensions, and installation of double track.

B. Evaluate those commuter rail line segments or crossings that would experience increased freight traffic as a result of the proposed transaction.

C. Discuss proposed transaction-related effects on existing or proposed commuter or passenger rail service (Metra, NICTD, AMTRAK) as appropriate (i.e., where capital improvements have been approved). Evaluate the capability of the EJ&E rail line segments or crossings to accommodate the reasonably foreseeable addition of commuter trains.

D. Discuss proposed transaction-related potential diversions of freight traffic from trucks to rail and from rail to trucks, as appropriate.

E. Address vehicular delays at rail crossings and intermodal facilities due to increases in rail traffic operations as a result of the proposed transaction. Estimates of typical delays will be made for highway/rail at-grade crossings, more detailed analysis will be done at highway/rail at-grade crossings that have an ADT of 2,500 vehicles per day or are within 800 feet of another crossing. Vehicle delay analysis will be done for traffic levels in years 2015 and 2020. Detailed analysis also will be conducted at highway/rail at-grade crossings that have an ADT of less than 2,500 vehicles per day, but have unique circumstances that make such evaluations appropriate.

F. Evaluate potential effects of proposed transaction-related highway/rail at-grade crossing blockage due to stopped trains.

G. Discuss potential effects of proposed transaction-related increased train traffic on emergency response facilities in proximity to the EJ&E rail line.

H. Discuss potential effects of proposed transaction-related increased train traffic on railroad bridges that cross navigation channels to the extent that such bridges allow only one mode of transportation to pass at a time (movable-span railroad bridges).

I. Discuss potential effects of proposed transaction-related increased train traffic on the Gary Chicago International Airport and its planned expansion.

4. Land Use

The EIS will:

A. Describe whether the construction of the proposed rail connections, siding extensions, and installation of double track are consistent with existing land use plans.

B. Describe environmental impacts associated with the construction of the proposed rail connections, siding extensions, and installation of double track on existing land use plans and potential effects on prime farmland.

C. Discuss potential effects of proposed transaction-related changes in rail operations on parks, forest preserves, and schools in the vicinity of the EJ&E rail line.

D. Discuss consistency of the construction of the proposed rail connections, siding extensions, and installation of double track with applicable zoning requirements.

5. Socioeconomics

The EIS will:

A. Address socioeconomic issues related to changes in the physical environment as a result of the proposed transaction.

B. Describe demographic characteristics of the transaction area and potential effects of the proposed transaction.

C. Evaluate economic effects of proposed acquisition-related construction and improvements to the EJ&E.

D. Discuss potential effects of proposed transaction-related increased train traffic on the potentially affected communities.

6. Hazardous Materials—Contaminated Sites

The EIS will:

A. Describe any recorded sites of contamination within or adjacent to areas potentially disturbed by proposed transaction-related construction activities.

B. Discuss known areas where spills of hazardous materials have occurred in the past and which may be affected by proposed transaction-related activities.

C. Discuss emergency response and clean up plans.

7. Energy

The EIS will:

A. Describe the potential environmental impact of the proposed transaction on transportation of energy resources and recyclable commodities.

B. Evaluate potential changes in fuel use arising from the proposed transaction.

8. Air Quality

The EIS will:

A. Evaluate air emissions increases where the proposed post-acquisition activity would exceed the Board's environmental thresholds in 49 CFR 1105.7(e)(5)(i), for air quality nonattainment areas as designated under the Clean Air Act. The applicable thresholds are as follows for the Chicago Metropolitan area, which is a nonattainment area: [7]

1. A 50 percent increase in rail traffic (measured in gross-ton miles annually) or an increase of three trains a day on any segment of rail line affected by the proposal; or

[7] Nonattainment areas are areas that do not comply with one or more ambient air quality standards. Ozone non-attainment areas are further classified as Marginal, Moderate, Serious, Severe, or Extreme Areas. These classifications are based on the level, in parts per million (ppm), of ozone measured for each area. Moderate areas are defined as .092 to .107 ppm, Serious Areas are defined as containing 0.107 ppm to 0.120 ppm, and Severe Areas are defined as containing 0.120 to 0.187 ppm. The Chicago area is currently classified as moderate non-attainment for ozone and non-attainment for PM 2.5.

2. An increase in rail yard activity of at least 20 percent or more in carload activity (rail car switching and block swapping).

3. Increase in truck traffic greater than 10 percent of average daily traffic (ADT) or 50 trucks per day.

B. Discuss the net change in emissions from changes in railroad operations associated with the proposed transaction. Net emissions changes will be calculated for counties with projected proposed transaction-related changes in train traffic.

C. Discuss the following information regarding the anticipated transportation of ozone depleting materials (such as nitrogen oxide and Freon):

1. Materials and quantity;

2. Applicants' safety practices;

3. Applicants' safety record (within the United States) on derailments, accidents, and spills;

4. Contingency plans to address accidental spills; and

5. Likelihood of an accidental release of ozone depleting materials in the event of a collision or derailment.

D. Discuss potential air emissions increases from vehicle delays at highway/rail at-grade crossings where the crossing is projected to experience a change in rail traffic arising from the proposed transaction over the thresholds described above. Such increases will be factored into the net emissions estimates for the affected area.

E. Estimate potential increases or decreases in diesel particulate emissions arising from the proposed transaction.

F. Discuss potential for changes in greenhouse gas emissions arising from the proposed transaction and how such changes may relate to climate change.

9. Noise and Vibration

The EIS will:

A. Describe potential noise and vibration impacts of the proposed transaction for those areas that exceed the Board's environmental thresholds identified in the Air Quality section.

B. Identify whether the proposed transaction-related increases in rail traffic will cause an increase to a noise level of 65 dBA L_{dn} and 3 dBA L_{dn} or greater. If so, an estimate of the number of sensitive receptors (*e.g.*, schools and residences) within such areas will be made.

C. Assess potential proposed transaction-related vibration effects based on Federal Transit Administration (FTA) vibration methodology in areas where it appears there may be vibration sensitive receptors within or immediately adjacent to the railroad right of way.

D. Discuss existing or planned Quiet Zones.

10. Biological Resources

The EIS will:

A. Discuss the potential environmental impacts of construction of proposed connections, siding extensions, and installation of double track on federal or state endangered or threatened species or designated critical habitats.

B. Discuss the effects of construction of proposed rail connections, siding extensions, and installation of double track on wildlife sanctuaries or refuges, and national or state parks or forests.

C. Discuss potential effects of proposed transaction-related increased train traffic on federal or state designated protected species or areas of special biological significance.

11. Water Resources

The EIS will:

A. Describe existing surface and groundwater resources in the vicinity of the EJ & E, particularly in areas of planned construction activity.

B. Discuss whether potential impacts from the construction of proposed rail connections, siding extensions, and installation of double track may be inconsistent with applicable federal or state water quality standards.

C. Discuss whether permits may be required under Sections 404 or 402 of the Clean Water Act (33 U.S.C. 1344) for any construction of proposed rail connections, siding extensions, and installation of double track, and whether any such projects have the potential to encroach upon any designated wetlands or 100-year floodplains.

D. Discuss hydrogeology in the study area and presence of any designated sensitive groundwater areas.

12. Environmental Justice

The EIS will:

A. Report on the demographics in the immediate vicinity of any area where major activity such as construction of rail connections, siding extensions, and/or installation double track is proposed.

B. Report on the demographics in the vicinity of rail lines with projected proposed transaction-related rail traffic increases above the Board's thresholds for environmental review.

C. Evaluate whether such activities potentially have a disproportionately high and adverse effect on any minority or low-income group.

13. Cultural and Historic Resources

The EIS will address potential impacts from the proposed construction of rail connections, siding extensions, and installation of double track on cultural and historic resources that are within areas potentially disturbed by construction activities.

14. Indirect and Cumulative Effects

The EIS will:

A. Address indirect and cumulative effects of environmental impacts that have regional or system-wide ramifications. This analysis will be done for environmental impacts that warrant such analysis given the context and scope of the proposed transaction.

B. Discuss as part of the indirect and cumulative impact analysis the potential environmental impacts of yard modification activities on railroad-owned property that would potentially be affected by the proposed transaction.

C. Evaluate indirect and cumulative effects, as appropriate, for other projects or activities that relate to the proposed transaction where SEA determines that there is the likelihood of significant environmental impacts and where information is provided to the Board that describes (1) those other projects or activities, (2) their interrelationship with the proposed acquisition, and (3) the type and severity of the potential environmental impacts. This information must be provided to the Board within sufficient time to allow for review and analysis in the EIS.

15. Mitigation

Where SEA determines there is potential for significant adverse impacts arising from the proposed transaction, SEA will consider reasonable mitigation measures that could reduce or eliminate such adverse impacts. SEA may consider a range of mitigation measures based on the nature and severity of the potential impact and consistent with the Board's jurisdiction and authority.

BILLING CODE 4915–01–P

DEPARTMENT OF TRANSPORTATION

Surface Transportation Board

Release of Waybill Data

The Surface Transportation Board has received a request from The Brookings Institution (WB971–1—4/7/08), for permission to use certain data from the Board's Carload Waybill Samples. A copy of this request may be obtained from the Office of Economics, Environmental Analysis, and Administration.

The waybill sample contains confidential railroad and shipper data;

Member State and via intermediate points to any point or points in the United States and beyond; (ii) foreign scheduled and charter air services between any point or points in the United States and any point or points in any member of the European Common Aviation Area; (iii) foreign scheduled and charter cargo air transportation between any point or points in the United States and any other point or points; (iv) other charters; and (v) transportation authorized by any additional route rights made available to European community carriers in the future.

Renee V. Wright,

Program Manager, Docket Operations, Federal Register Liaison.

DEPARTMENT OF TRANSPORTATION

Surface Transportation Board

[STB Finance Docket No. 35087]

Canadian National Railway Company and Grand Trunk Corporation—Control—EJ&E West Company

AGENCY: Surface Transportation Board.

ACTION: Notice of Correction to the Final Scope of Study for the Environmental Impact Statement (EIS).

SUMMARY: The Section of Environmental Analysis (SEA) issued the Final Scope of Study in the above-captioned proceeding on April 25, 2008 and published the Final Scope of Study in the **Federal Register** on April 28, 2008. It has come to our attention that a statement on page 7 of the Final Scope is confusing and open to various interpretations.

Therefore, we will strike this language:

Thus, the EIS will use a five-year threshold from the date of the anticipated year of the issuance of a final decision (2015) for analysis of effects of increased rail traffic, such as vehicle delay. This year was selected because five years is not too long to produce reasonable and reliable freight rail forecasts.

And replace it with:

Thus, the EIS will use a year 2015 threshold for analysis of effects of increased rail traffic, such as vehicle delay. This year was selected because it would provide at least five years of data to be considered in order to produce reasonable and reliable freight rail forecasts.

Please correct your copies accordingly. A corrected version of the Final Scope is available on the Board's Web site at *http://www.stb.dot.gov.*

Decided: April 28, 2008.

By the Board, Victoria Rutson, Chief, Section of Environmental Analysis.

Anne K. Quinlan,

Acting Secretary.

DEPARTMENT OF TRANSPORTATION

Surface Transportation Board

[STB Finance Docket No. 35136]

Burlington Shortline Railroad, Inc., d/b/a Burlington Junction Railway—Lease and Operation Exemption—BNSF Railway Company

Burlington Shortline Railroad, Inc., d/b/a Burlington Junction Railway (BJR), a Class III rail carrier, has filed a verified notice of exemption under 49 CFR 1150.41 to lease and to operate, pursuant to an agreement with BNSF Railway Company (BNSF), approximately 2.5 miles of BNSF railroad properties consisting of certain trackage, real property, and railroad operating rights located at Montgomery, IL. The rail properties being leased consist of land and tracks owned by BNSF adjacent to and within the Montgomery Industrial Park, located between milepost 39.40 and milepost 40.50 on BNSF's east-west Main 1, Track 3998, and Main 2, track 3999, but excluding BNSF's Main 1, Main 2, and the Old North Main Track 3900. In particular, the lease agreement pertains to track numbers 3901, 3902, 3903, 3904, the segment of track 3930 between tracks 3900 and 3932, and the segment of track 3930 between the northern terminus of track 3931 and track 3942.[1]

BNSF is granting to BJR incidental trackage rights for interchange purposes over track 3900 (the Old North Main) between track numbers 3904 and 3930.

BNSF is also assigning to BJR its contractual rights to operate over certain private industrial track (not owned by BNSF) used to serve shippers in the area, pertaining to track numbers 3905, 3906, 3907, 3908, 3909, 3914, 3915, 3920, 3931, 3932, 3933, 3940, 3941, 3942, 3943, 3944, 9916, 9976, and the portions of track 3930 not owned by BNSF.

BJR, in turn, is granting BNSF interchange rights for the use of BJR's leased yard tracks at Montgomery, IL, for the sole purpose of interchanging traffic between the parties on track numbers 3901 and 3902.

The earliest this exemption can be consummated is May 21, 2008, the effective date of the exemption (30 days after the exemption is filed).

BJR certifies that its projected annual revenues as a result of this transaction will not exceed those that qualify it as a Class III rail carrier and will not exceed $5 million.

Pursuant to the Consolidated Appropriations Act, 2008, Public Law 110–161, section 193, 121 Stat. 1844 (2007), nothing in this decision authorizes the following activities at any solid waste rail transfer facility: Collecting, storing or transferring solid waste outside of its original shipping container; or separating or processing solid waste (including baling, crushing, compacting and shredding). The term ''solid waste'' is defined in section 1004 of the Solid Waste Disposal Act, 42 U.S.C. 6903.

If the verified notice contains false or misleading information, the exemption is void *ab initio.* Petitions to revoke the exemption under 49 U.S.C. 10502(d) may be filed at any time. The filing of a petition to revoke will not automatically stay the effectiveness of the exemption. Petitions to stay must be filed by no later than May 14, 2008 (at least 7 days before the exemption becomes effective).

An original and 10 copies of all pleadings, referring to STB Finance Docket No. 35136, must be filed with the Surface Transportation Board, 395 E Street, SW., Washington, DC 20423–0001. In addition, a copy must be served on John D. Heffner, John D. Heffner, PLLC, 1750 K Street, NW., Suite 350, Washington, DC 20006.

Board decisions and notices are available on our Web site at *http://www.stb.dot.gov.*

Decided: April 29, 2008.

By the Board, David M. Konschnik, Director, Office of Proceedings.

Anne K. Quinlan,

Acting Secretary.

BILLING CODE 4915–01–P

[1] BJR originally filed a notice of exemption to acquire and operate the subject rail properties in *Burlington Shortline Railroad, Inc., d/b/a Burlington Junction Railway Company—Acquisition and Operation Exemption—BNSF Railway Company,* STB Finance Docket No. 35121 (STB served Apr. 3, 2008, and published at 73 FR 18322). Ozinga Bros., Inc., filed a petition to reject or stay the exemption, and the Board issued a housekeeping stay on April 16, 2008, in that docket to allow time to consider any replies and to make an informed decision. BJR requested permission to withdraw that notice on April 21, 2008, and concurrently filed the instant notice clarifying that the acquisition transaction was by lease rather than purchase and explaining in more detail the involved rail property and the proposed transaction. By decision served on April 29, 2008, the Board granted BJR's withdrawal request, discontinued the proceeding in STB Finance Docket No. 35121, and vacated the stay in that proceeding as moot.

Summary: EPA expressed environmental concerns about potential water quality impacts to riparian/stream systems due to past grazing activities. EPA supports adaptive management practices proposed by the Forest Service for improve existing resource conditions impacted by grazing and long-term drought. EPA requested that the final EIS include a drought management plan and baseline data for monitoring and protecting water quality. Rating EC2.

EIS No. 20080219, ERP No. D–NOA–E39073–00, Programmatic—Coral Restoration in the Florida Keys and Flower Garden Banks National Marine Sanctuaries, Implementation, FL, TX, and LA.

Summary: EPA does not object to the proposed action, but requested additional data to clarify timeframes of coral growth and the level of effort to conduct the restoration projects. Rating LO.

Dated: July 29, 2008.

Interim Approach to Applying the Audit Policy to New Owners

AGENCY: Environmental Protection Agency.

ACTION: Notice; request for comment.

SUMMARY: The Environmental Protection Agency (''EPA'' or ''the Agency'') announces and requests comment on its Interim Approach to Applying the Audit Policy to New Owners (''Interim Approach''). (EPA's April 11, 2000 policy on ''Incentives for Self-Policing: Discovery, Disclosure, Correction and Prevention of Violations,'' is commonly referred to as the ''Audit Policy'' (65 FR 19618).) This Interim Approach offers a detailed description of how EPA will apply its Audit Policy to new owners of regulated facilities. Under the Interim Approach, EPA will offer certain incentives specifically tailored to new owners that want to make a ''clean start'' at their newly acquired facilities by addressing environmental noncompliance that began prior to acquisition. This Interim Approach is designed to motivate new owners to audit newly acquired facilities and use the Audit Policy to disclose, correct, and prevent the recurrence of violations. It is also designed to encourage self-disclosures of violations that will, once corrected, yield significant pollutant reductions and benefits to the environment. The incentives tailored for new owners include penalty mitigation

Re: Proposed Canadian National Railway Company Acquisition of the Elgin, Joliet and Eastern Railway Company, STB Finance Docket No. 35087

Dear [Title & Last Name]:

The Surface Transportation Board, Section of Environmental Analysis is currently in the process of reviewing the Canadian National Railway Company's (CN) proposed acquisition of the Elgin, Joliet and Eastern Railway Company (EJ&E). As a part of this review, we are meeting with area community leaders to discuss project issues from the perspective of low-income or minority citizens. Our goal is to gather your community's concerns regarding safety, air quality, land use, socioeconomic, cultural, historic resources, or any other concerns with regards to this acquisition. In addition, we would like to better understand how to involve your community in future public participation activities.

Enclosed, please find 1) map showing the CN and EJ&E rail lines and 2) information about the proposed acquisition. These materials have been made available to the public during project scoping meetings held in January 2008 and are available on our project web site: www.stbfinancedocket35087.com

A representative from our team will follow-up to schedule a meeting with you at your convenience. In the interim, if you have any questions, please feel free to contact Rich Christopher at 773-867-7238 or via email at Richard.Christopher@hdrinc.com.

Sincerely,

Victoria J. Rutson
Chief
Section of Environmental Analysis

Metropolitan Mayor's Caucus Meeting Summary

Metropolitan Mayor's Caucus Meeting
June 25, 2008
9:00 a.m.
Meeting Summary

- Start time: 9:07 a.m. End time: 10:48 a.m.
- Meeting began with introductions by Executive Director of MMC followed by attendees
- In attendance were 27 Mayors/Village Presidents/Members of the Caucus
- Representing the STB: Vicki Rutson, Evelyn Kitay and Matt Wallen
- Representing HDR: John Morton, Marty Joyce and Rich Christopher
- Representing MWW: Tina-Marie Adams and Heather Tarczan
- C.O.R.A map on display
- Handouts for guests included: C.O.R.A map, fact sheet, Final Statement of Scope, Slides from January open house
- Ongoing reference to the Web site was mentioned
- V. Rutson began with overview that included: The origin of the STB and the environmental review process, about NEPA, CN's reasons for wanting to purchase the EJ&E and next steps
- All questions were answered by STB and/or HDR

Questions/Comments Made During the Meeting:

1. Mitigation
    a. Clarification on the kinds of mitigation
    b. Can the STB require it?
    c. Would it be permanent or temporary?
    d. Can quiet zones be part of the required mitigation?
2. Who determines the costs of mitigation?
    a. Does the Board look at the costs of the RR purchase when determining amount of mitigation?
    b. Can upgrades to tracks be required?
3. Does Board weigh pros and cons of transaction equally?
4. Who are the members of the board?
5. Concern for jobs in the area
6. Clarification on what is considered environmental
7. Can traffic be controlled on the existing lines?
8. Can CN lease the EJ& E tracks without approval from the Board?
9. Is the Board looking at the CN Prince Rupert Port and movement of traffic?
10. Concerns about CN's five-year traffic projection being too short
    a. AAR has released study with projections into 2035
    b. Concern that CN would increase trains in subsequent years

11. Concern about the STAR and Southshore Lines and track sharing
12. Does the Board review effects of gas prices as well as passenger rail pollution?
13. Costs of grade separations and who funds them?
    a. Is CN accurate in stating that there is no precedent for RR's to have to fund grade separations?
14. What are the Board's limitations?
15. What is the best way to communicate the stress of diesel trains holding in our community for 20+ hours?
16. How long with the comment period for the DEIS be?
17. Is quality of life factored into the Board's consideration?
18. Will CN's safety record be examined?
    a. What about their safety record in Canada?

Re: Proposed Canadian National Railway Company Acquisition of the Elgin, Joliet and Eastern Railway Company, STB Finance Docket No. 35087

Dear Reader:

The Surface Transportation Board (STB) has completed its Draft Environmental Impact Statement (Draft EIS) for the proposed Canadian National Railway Company's acquisition of the Elgin, Joliet and Eastern Railway Company. The Draft EIS is available for public review and comment.

In order to present the findings of this Draft EIS and to allow ample opportunity for public comment, eight public meetings are planned throughout the project area as shown in the table below:

Public Meeting Dates and Locations

Date	Location	Address
Monday, August 25	Matteson, Illinois Holiday Inn Hotel & Conference Center	500 Holiday Plaza Drive Matteson, IL 60443
Tuesday, August 26	Mundelein, Illinois Crowne Plaza Chicago North Shore	510 E. Route 83 Mundelein, IL 60060
Wednesday, August 27	Barrington, Illinois Barrington High School	616 W. Main Street Barrington, IL 60010
Thursday, August 28	Bartlett, Illinois Bartlett High School	701 Schick Road Bartlett, IL 60103
Monday, September 8	Chicago, Illinois Loyola University of Chicago	25 E. Pearson Chicago, IL 60611
Tuesday, September 9	Aurora, Illinois West Aurora High School	1201 W.. New York St. Aurora, IL 60506
Wednesday, September 10	Gary, Indiana Indiana University Northwest	3400 Broadway Gary, IN 46408
Thursday, September 11	Joliet, Illinois Holiday Inn Hotel & Conference Center	411 S. Larkin Avenue Joliet, IL 60436

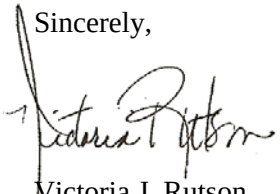
The same information will be presented at each meeting and will follow the schedule outlined below:

Open House – 4:00 PM – 6:00 PM	SEA staff will be available to answer questions and help members of the public review project maps and other findings of the Draft EIS and analysis.
Public Meeting – 6:00 PM – 9:00 PM	SEA staff will make a short presentation to the public and will then be available to receive formal comments on the Draft EIS. This portion of the meeting will be held for the purpose of receiving comment. It is not a question-and-answer session. Speaker registration will be determined on a first come first serve basis by calling the hotline to pre-register in advance (1-800-347-0689) or at the sign-in tables the day of the public meeting. Each speaker will be allocated up to 3 minutes to present their comment.

In addition to formal comments presented at the public meetings, comments may be submitted through the following methods:

- **Written Comments**: Comment forms will be provided at the public meetings and will be accepted on site or by mail; written letters will also be accepted at the public meetings. Additionally, comment forms or written letters can be sent to:

  Phillis Johnson-Ball
  Surface Transportation Board
  395 E Street, SW
  Washington, DC 20423
  Ref. STB Finance Docket No. 35087



- **Recorded Comments**: Court reporters will be available at the public meetings for those who wish to dictate their comments in a more informal setting. Comments may also be recorded at any time during the comment period on the project hotline: 1-800-347-0689.

- **Electronic Comments**: Submit electronic comments by visiting the STB's website, www.stb.dot.gov, under the heading "E_FILING". Please refer to STB Finance Docket No. 35087

All comments received will carry equal weight in helping to finalize the EIS and guide the Board in their decision making on this matter. The comment period on the Draft EIS will end on September 30, 2008.

For further information on the proceedings, please visit the project web site at www.stbfinancedocket35087.com or call the toll-free information line at 1-800-347-0689. You may also visit the Board's website (www.stb.dot.gov) and look for Key Cases under Environmental Matters.

Sincerely,

Victoria J. Rutson

Letter of Invitation to Northern Indiana Agencies and Governments Stakeholders

Re: STB Finance Docket No. 35087, Canadian National Railway Company Proposed Acquisition of the Elgin, Joliet and Eastern Railway Company; **Notice of Stakeholder Meeting**

Dear -----

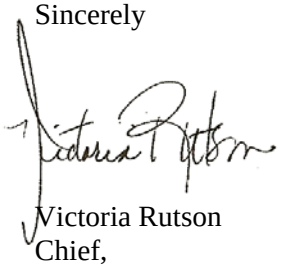
I am writing to invite to the next Northern Indiana Agencies/Governments Stakeholders' meeting on:

Wednesday, September 3, 2008
2 p.m. - 4 p.m.
Purdue University, Calumet
The Calumet Conference Center
2300 173rd Street
Hammond, IN

This meeting follows the initial meeting of the Northern Indiana Agencies/Governments Stakeholder Group held on April 30 at the Country Inn Suites in Portage, IN. We received valuable information at that meeting about your issues of concern. These issues were all considered for analysis in the Draft EIS, which is currently available for public review and comment. Comments on the Draft EIS are due on September 30, 2008.

We are now ready to hold the second round of Stakeholder Meetings. The purpose of this round of meetings is to receive your feedback on the Draft EIS, continue to identify stakeholder concerns, and discuss any possible resolution of concerns raised by the stakeholders. In short, the intent of these meetings is to develop a greater understanding about your views on the Draft EIS for use in the Board's decision making.

Other stakeholder meetings that will be held this same week include:



- Illinois Natural Resources/Water Resources Agencies on Tuesday from 9:00 a.m. – 12:00 p.m. at HDR's Bryn Mawr office
- Illinois Transportation/Safety Agencies on Tuesday from 1:00 p.m. – 3:00 p.m. at HDR's Bryn Mawr office
- Illinois Local Governments on Wednesday from 9:00 a.m. to 12:00 p.m. at HDR's Bryn Mawr office
- Indiana State Agencies on Thursday from 10:00 a.m. until noon at Courtyard by Marriott Capitol at 320 N. Senate Avenue in Indianapolis, IN

We hope that you will be able to attend this stakeholder meeting. If you can attend, please contact Rich Christopher of HDR at (773) 867-7238 and provide the name of the participant from your agency if your organization or agency plans to attend the Northern Indiana Agencies/Governments Stakeholder

meeting on September 3. I have enclosed a proposed meeting agenda as well as a chronology for the project as background information for the meeting.

We look forward to your on-going participation in this EIS process and hope to see you at the stakeholder meeting.

Sincerely

Victoria Rutson

Letter of Invitation to Illinois Natural Resources and Water Resources Stakeholders

Re: Notice of Agency Stakeholder Meetings for the Proposed Canadian National Railway Company Acquisition of the Elgin, Joliet and Eastern Railway Company, STB Finance Docket No. 35087

Dear -----

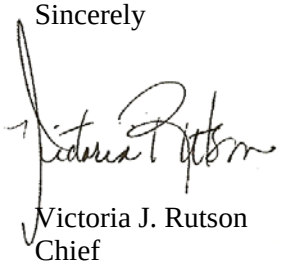
I am writing to you regarding the development of the Surface Transportation Board's (Board) environmental review process for the Canadian National Railway Company's (CN) proposed acquisition of the Elgin, Joliet and Eastern Railway Company (EJ&E). You are invited to the next Illinois Natural Resources/Water Resources Agencies Stakeholders' meeting on:

Tuesday, September 2, 2008
9 a.m. -12 p.m.
HDR, Suite 900
8550 W. Bryn Mawr Avenue
Chicago, IL, 60631
(773) 380-7900

The initial meeting of the Illinois Natural Resources/Water Resources Stakeholder group was held on April 29 at HDR's office on W. Bryn Mawr Ave. We received valuable information about your issues of concern. These issues were all considered for analysis in the Draft EIS which is currently available for public review.

The Board is now ready to hold the second of these meetings to answer any questions you may have about information in the Draft EIS or information not included in the Draft EIS. The intent of these meetings is to develop a greater understanding about your views on the Draft EIS for use in the Board's decision making.

Other stakeholder meetings that will be held this same week include:



- Illinois Transportation/Safety Agencies on Tuesday from 1:00 p.m.– 3:00 p.m.at HDR's Bryn Mawr office
- Illinois Local Governments on Wednesday from 9:00 am to 12:00 p.m. at HDR's Bryn Mawr office
- Northern Indiana Agencies/Governments on Wednesday from 2:00 p.m. to 4:00 p.m. at Purdue University Calumet, The Calumet Conference Center, 2300 173rd Street in Hammond, IN
- Indiana State Agencies on Thursday from 10:00 a.m. until noon at Courtyard by Marriott Capitol at 320 N. Senate Avenue in Indianapolis, IN

We encourage your participation in, and support of the stakeholder meetings. Please contact Rich Christopher of HDR at (773) 867-7238 to provide the name of the participant from your agency if your organization or agency plans to attend the Illinois Natural Resources/Water Resources Stakeholder

meeting on September 2. Enclosed is the meeting agenda. We have also attached a chronology for the project as background information for the meeting.

We look forward to your on-going participation in the EIS process for the proposed transaction.

Sincerely

Victoria J. Rutson
Chief

Re: STB Finance Docket No. 35087, Canadian National Railway Company Proposed Acquisition of the Elgin, Joliet and Eastern Railway Company; Notice of Stakeholder Meeting

Dear Salutation Last Name,

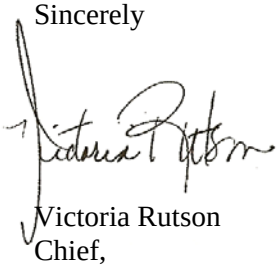
I am writing to invite you to the next Illinois Transportation/Safety Agencies Stakeholders' meeting on:

Tuesday, September 2, 2008
1 p.m. - 3 p.m.
HDR, Suite 900
8550 W. Bryn Mawr Avenue
Chicago, IL, 60631
(773) 380-7900

This meeting follows the initial meeting of the Illinois Transportation/Safety Agencies Stakeholder Group held on April 29 at the same location (HDR's office on W. Bryn Mawr Ave). We received valuable information at that meeting about your issues of concern. These issues were all considered for analysis in the Draft EIS, which is currently available for public review and comment. Comments on the Draft EIS are due on September 30, 2008.

We are now ready to hold the second round of Stakeholder Meetings. The purpose of this round of meetings is to receive your feedback on the Draft EIS, continue to identify stakeholder concerns, and discuss any possible resolution of concerns raised by the stakeholders. In short, the intent of these meetings is to develop a greater understanding about your views on the Draft EIS for use in the Board's decision making.

Other stakeholder meetings that will be held this same week include:



• Illinois Natural Resources/Water Resources Agencies on Tuesday from 9:00 a.m. – 12:00 p.m. at HDR's Bryn Mawr office
• Illinois Local Governments on Wednesday from 9:00 a.m. to 12:00 p.m. at HDR's Bryn Mawr office
• Northern Indiana Agencies/Governments on Wednesday from 2:00 p.m. to 4:00 p.m. at Purdue University Calumet, The Calumet Conference Center, 2300 173rd Street in Hammond, IN

• Indiana State Agencies on Thursday from 10:00 a.m. until noon at Courtyard by Marriott Capitol at 320 N. Senate Avenue in Indianapolis, IN

We hope you are able to attend this stakeholder meeting. If you can attend, please contact Rich Christopher of HDR at (773) 867-7238 and provide the name of the participant from your agency if your organization or agency plans to attend the Illinois Transportation/Safety Agencies Stakeholder meeting on September 2. I have enclosed a proposed meeting agenda as well as a chronology for the project as background information for the meeting.

We look forward to your on-going participation in this EIS process and hope to see you at the stakeholder meeting.

Sincerely

Letter of Invitation to Indiana State Agencies Stakeholders

Re: STB Finance Docket No. 35087, Canadian National Railway Company Proposed Acquisition of the Elgin, Joliet and Eastern Railway Company; **Notice of Stakeholder Meeting**

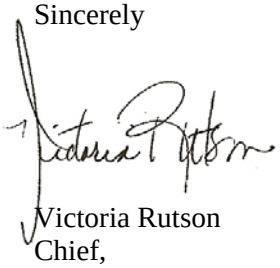
Dear -----

I am writing to invite you to the next Indiana State Agencies Stakeholders' meeting on:

Thursday, September 4, 2008
10 a.m. - 12 p.m.
Courtyard by Marriott Capitol
320 N Senate Avenue
Indianapolis, IN

This meeting follows the initial meeting of the Indiana State Agencies Stakeholder Group held on May 1 in Indianapolis. We received valuable information at that meeting about your issues of concern. These issues were all considered for analysis in the Draft EIS, which is currently available for public review and comment. Comments on the Draft EIS are due on September 30, 2008.

We are now ready to hold the second round of Stakeholder Meetings. The purpose of this round of meetings is to receive your feedback on the Draft EIS, continue to identify stakeholder concerns, and discuss any possible resolution of concerns raised by the stakeholders. In short, the intent of these meetings is to develop a greater understanding about your views on the Draft EIS for use in the Board's decision making.



Other stakeholder meetings that will be held this same week include:

• Illinois Natural Resources/Water Resources on Tuesday from 9:00 a.m. – 12:00 p.m. at HDR's Bryn Mawr office
• Illinois Transportation/Safety Agencies on Tuesday from 1:00 p.m. – 3:00 p.m. at HDR's Bryn Mawr office
• Illinois Local Governments on Wednesday from 9:00 a.m. to 12:00 p.m. at HDR's Bryn Mawr office
• Northern Indiana Agencies/Governments on Wednesday from 2:00 p.m. to 4:00 p.m. at Purdue University Calumet, The Calumet Conference Center, 2300 173rd Street in Hammond, IN

We hope that you will be able to attend this stakeholder meeting. If you can attend, please contact Rich Christopher of HDR at (773) 867-7238 and provide the name of the participant from your agency if your organization or agency plans to attend the Indiana State Agencies Stakeholder meeting on September 4. I have enclosed a proposed meeting agenda as well as a chronology for the project as background information for the meeting.

We look forward to your on-going participation in this EIS process and hope to see you at the stakeholder meeting.

Environmental Impact Statement

August 2008

STB Finance Docket No. 35087

As part of the EIS process, the Board's Section of Environmental Analysis (SEA) will hold eight public meetings to present the findings of the Draft EIS and to allow an opportunity for public comment on the document.

1 Monday, August 25, 2008
Holiday Inn
500 Holiday Plaza Dr.
Matteson, IL 60443

2 Tuesday, August 26, 2008
Crowne Plaza Hotel
510 E. Route 83
Mundelein, IL 60060

3 Wednesday, August 27, 2008
Barrington High School
616 W Main St.
Barrington, IL 60010

4 Thursday, August 28, 2008
Bartlett High School
701 W Schick Rd.
Bartlett, IL 60103

5 Monday, September 8, 2008
Loyola University of Chicago
Rubloff Auditorium
25 E. Pearson St.
Chicago, IL 60611

6 Tuesday, September 9, 2008
West Aurora High School
1201 W. New York St.
Aurora, IL 60506

7 Wednesday, September 10, 2008
Indiana University Northwest
Auditorium
3400 Broadway
Gary, IN 46408

8 Thursday, September 11, 2008
Holiday Inn
411 S Larkin Ave.
Joliet, IL 60436

The same information will be presented at each meeting and will follow the schedule outlined below:

Open House – 4:00 PM – 6:00 PM

Board staff and HDR, Inc. will be available to answer questions and help members of the public review project maps and other findings of the Draft EIS analysis.

Public Meeting – 6:00 PM – 9:00 PM

Board staff and HDR, Inc will make a short presentation to the public and will then be available to receive formal comments on the Draft EIS. This portion of the meeting will be held for the purpose of receiving comments. It is not intended to be a question-and-answer session.

Speaker registration will be determined on a first come, first served basis by calling the hotline to pre-register in advance (1-800-347-0689) or by registering at the sign-in tables the day of the public meeting. Each speaker will be allocated up to 3 minutes to present his or her comments.

SURFACE TRANSPORTATION BOARD
Washington, DC 20423

Section of Environmental Analysis

July 25, 2008

Re: Proposed Canadian National Railway Company Acquisition of the Elgin, Joliet and Eastern Railway Company, STB Finance Docket No. 35087

Dear Reader:

The Surface Transportation Board (STB) has completed its Draft Environmental Impact Statement (Draft EIS) for the proposed Canadian National Railway Company's acquisition of the Elgin, Joliet and Eastern Railway Company. The Draft EIS is available for public review and comment.

In order to present the findings of this Draft EIS and to allow ample opportunity for public comment, eight public meetings are planned throughout the project area as shown in the table below:

Public Meeting Dates and Locations

Date	Location	Address
Monday, August 25	Matteson, Illinois Holiday Inn Hotel & Conference Center	500 Holiday Plaza Drive Matteson, IL 60443
Tuesday, August 26	Mundelein, Illinois Crowne Plaza Chicago North Shore	510 E. Route 83 Mundelein, IL 60060
Wednesday, August 27	Barrington, Illinois Barrington High School	616 W. Main Street Barrington, IL 60010
Thursday, August 28	Bartlett, Illinois Bartlett High School	701 Schick Road Bartlett, IL 60103
Monday, September 8	Chicago, Illinois Loyola University of Chicago	25 E. Pearson Chicago, IL 60611
Tuesday, September 9	Aurora, Illinois West Aurora High School	1201 W.. New York St. Aurora, IL 60506
Wednesday, September 10	Gary, Indiana Indiana University Northwest	3400 Broadway Gary, IN 46408
Thursday, September 11	Joliet, Illinois Holiday Inn Hotel & Conference Center	411 S. Larkin Avenue Joliet, IL 60436

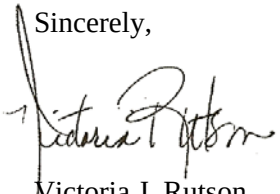
The same information will be presented at each meeting and will follow the schedule outlined below:

Open House – 4:00 PM – 6:00 PM	SEA staff will be available to answer questions and help members of the public review project maps and other findings of the Draft EIS and analysis.
Public Meeting – 6:00 PM – 9:00 PM	SEA staff will make a short presentation to the public and will then be available to receive formal comments on the Draft EIS. This portion of the meeting will be held for the purpose of receiving comment. It is not a question-and-answer session. Speaker registration will be determined on a first come first serve basis by calling the hotline to pre-register in advance (1-800-347-0689) or at the sign-in tables the day of the public meeting. Each speaker will be allocated up to 3 minutes to present their comment.

In addition to formal comments presented at the public meetings, comments may be submitted through the following methods:

- **Written Comments**: Comment forms will be provided at the public meetings and will be accepted on site or by mail; written letters will also be accepted at the public meetings. Additionally, comment forms or written letters can be sent to:

  Phillis Johnson-Ball
  Surface Transportation Board
  395 E Street, SW
  Washington, DC 20423
  Ref. STB Finance Docket No. 35087



- **Recorded Comments**: Court reporters will be available at the public meetings for those who wish to dictate their comments in a more informal setting. Comments may also be recorded at any time during the comment period on the project hotline: 1-800-347-0689.

- **Electronic Comments**: Submit electronic comments by visiting the STB's website, www.stb.dot.gov, under the heading "E_FILING". Please refer to STB Finance Docket No. 35087

All comments received will carry equal weight in helping to finalize the EIS and guide the Board in their decision making on this matter. The comment period on the Draft EIS will end on September 30, 2008.

For further information on the proceedings, please visit the project web site at www.stbfinancedocket35087.com or call the toll-free information line at 1-800-347-0689. You may also visit the Board's website (www.stb.dot.gov) and look for Key Cases under Environmental Matters.

Sincerely,

Victoria J. Rutson
Chief
Section of Environmental Analysis

Environmental Impact Statement

OPEN HOUSE/ PUBLIC MEETINGS

On July 25, 2008, the Surface Transportation Board (Board) served the Draft Environmental Impact Statement (Draft EIS) for the proposed Canadian National Railway Company's acquisition of the Elgin, Joliet & Eastern Railway. As part of the EIS process, the Board's Section of Environmental Analysis (SEA) will hold eight public meetings to present the findings of the Draft EIS and to allow an opportunity for public comment on the document.

SEA will hold the public meetings on the following dates and at the following locations:

The same information will be presented at each meeting and will follow the schedule outlined below:

OPEN HOUSE
4:00 PM – 6:00 PM

SEA and its consultant, HDR, Inc. will be available to answer questions and help members of the public review project maps and other findings of the Draft EIS analysis.

PUBLIC MEETING
6:00 PM – 9:00 PM

SEA will make a short presentation to the public and will then be available to receive formal comments on the Draft EIS. This portion of the meeting will be held for the purpose of receiving comments. It is not intended to be a question-and-answer session.

Speaker registration will be determined on a first come first serve basis by calling the hotline to pre-register in advance (1-800-347-0689) or by registering at the sign-in tables the day of the public meeting. Phone registration will end at 6 PM the day prior to the meeting. Each speaker will be allocated up to 3 minutes to present his or her comments.

SURFACE TRANSPORTATION BOARD
OPEN HOUSE/PUBLIC MEETINGS

On July 25, 2008, the Surface Transportation Board (Board) served the Draft Environmental Impact Statement (Draft EIS) for the proposed Canadian National Railway Company's acquisition of the Elgin, Joliet & Eastern Railway. As part of the EIS process, the Board's Section of Environmental Analysis (SEA) will hold eight public meetings to present the findings of the Draft EIS and to allow an opportunity for public comment on the document.

SEA will hold the public meetings on the following dates and at the following locations:

1 Monday, August 25, 2008
Holiday Inn
500 Holiday Plaza Dr.
Matteson, IL 60443

2 Tuesday, August 26, 2008
Crowne Plaza Hotel
510 E. Route 83
Mundelein, IL 60060

3 Wednesday, August 27, 2008
Barrington High School Gym
616 W. Main St.
Barrington, IL 60010

4 Thursday, August 28, 2008
Bartlett High School Auditorium
701 W. Schick Rd.
Bartlett, IL 60103

5 Monday, September 8, 2008
Loyola University of Chicago
Rubloff Auditorium
25 E. Pearson St.
Chicago, IL 60611

6 Tuesday, September 9, 2008
West Aurora High School Auditorium
1201 W. New York St.
Aurora, IL 60506

7 Wednesday, September 10, 2008
Indiana University Northwest
Savannah Center
3400 Broadway
Gary, IN 46408

8 Thursday, September 11, 2008
Holiday Inn
411 S. Larkin Ave.
Joliet, IL 60436

The meeting facilities comply with the Americans with Disabilities Act. Persons who need additional special accommodations should call 1-800-347-0689 48 hours prior to the public meeting.

The same information will be presented at each meeting and will follow the schedule outlined below:

Open House – 4:00 PM – 6:00 PM

SEA and its consultant, HDR, Inc. will be available to answer questions and help members of the public review project maps and other findings of the Draft EIS analysis.

Public Meeting – 6:00 PM – 9:00 PM

SEA will make a short presentation to the public and will then be available to receive formal comments on the Draft EIS. This portion of the meeting will be held for the purpose of receiving comments. It is not intended to be a question-and-answer session.

Speaker registration will be determined on a first come first serve basis by calling the hotline to pre-register in advance (1-800-347-0689) or by registering at the sign-in tables the day of the public meeting. Phone registration will end at 6 PM the day prior to the meeting. Each speaker will be allocated up to 3 minutes to present his or her comments.

Please send written comments to: Phillis Johnson-Ball, Surface Transportation Board, 395 E Street, SW, Washington, DC 20423; Attention: Environmental Filing, STB Finance Docket No. 35087. Submit electronic comments by visiting the Board's website, www.stb.dot.gov, under the heading E-Filing. Please refer to STB Finance Docket No. 35087. Court reporters will be available at the meeting for those who wish to dictate their comments instead of presenting them publicly. Comments may also be recorded at any time during the comment period on the project hotline: 1-800-347-0689.

All comments received will carry equal weight in helping to finalize the EIS and guide the Board in its decision making on this matter. ***The comment period on the Draft EIS will end on September 30, 2008.***

For further information on this proceeding, please visit the project website at www.stbfinancedocket35087.com, or call the toll-free information line at 1-800-347-0689. You may also visit the Board's website (www.stb.dot.gov) and look for Key Cases under Environmental Matters.

PUBLIC NOTICE

Public Notice is hereby given by the Community Development Commission of the City of Chicago (the "City") pursuant to section 5/11-74.4-4 of the Illinois Tax Increment Allocation Redevelopment Act, as amended (65ILCS 5/11-74.4-1 et seq.) (the "Act"), that the City's Department of Housing ("DOH") intends to negotiate a redevelopment agreement with Gateway to Lawndale LLC (the "Developer") pursuant to which the City intends to convey to the Developer the City-owned parcels identified below (the "Disposition Parcels"), which Disposition Parcels are located in the Midwest TIF Redevelopment Project Area (the "Area"), for the Developer's construction of affordable, for-sale single-family residences on such Disposition parcels in accordance with the New Homes for Chicago program. The Disposition Parcels shall be conveyed for $1.00 each. The Disposition Parcels are located within the Area established pursuant to the Act, and the Project is in compliance with the Midwest TIF Redevelopment Plan. The Area is generally bounded as follows:

On the north by 53rd Street, on the south by Marquette Road, on the east by Racine Avenue, and on the west by Leavitt Street.

THE CITY HEREBY INVITES ALTERNATIVE PROPOSALS FOR THE REDEVELOPMENT OF THE DISPOSITION PARCELS FOR CONSIDERATION BY THE CITY.

The documents listed below related to the Area, the Project and the Disposition Parcels are available for public inspection on or before August 11, 2008 at the offices of DOH, which are located on 2ND Floor, 33 N. LaSalle, Chicago, Illinois between the hours of 9:00 a.m. and 4:00 p.m.,
Monday through Friday:

(i) "63rd/Ashland Tax Increment Financing Redevelopment Project and Plan," which constitutes the City's redevelopment plan for the Area;
(ii) a term sheet showing all proposed material terms of the Redevelopment Agreement as of the date hereof;
(iii) the terms of all bids and proposals received, if any, by the City related to the Project and the redevelopment agreements; and
(iv) the terms and conditions of the New Homes for Chicago Program.

Please contact Mark Roschen at (312) 742-0854 to review these materials and for information regarding the form required, if any, for proposals submitted to the City. Proposals shall include the general plan for the redevelopment of the Disposition Parcels, the names of the party or parties making the proposal, the price offered, evidence of financial qualifications and capacity to complete said redevelopment, and the timetable for implementation. The City reserves the right to reject any and all proposals. Proposals will be received by the City at DOH's offices, which are located on 2ND Floor, 33 North LaSalle St., Chicago, Illinois, 60602, until September 10, 2008 at 2:00 p.m., at which time all alternative proposals will be opened and reviewed.

The Disposition Parcels are located at the following addresses:

NOTICE OF OPEN HOUSE/PUBLIC MEETINGS
Surface Transportation Board
Section of Environmental Analysis

On July 25, 2008, the Surface Transportation Board (Board) served the Draft Environmental Impact Statement (Draft EIS) for the proposed Canadian National Railway Company's acquisition of the Elgin, Joliet & Eastern Railway. As part of the EIS process, the Board's Section of Environmental Analysis (SEA) will hold eight public meetings to present the findings of the Draft EIS and to allow an opportunity for public comment on the document.

All open houses are 4–6 PM with public meetings from 6–9 PM. SEA will hold the public meetings on the following dates and at the following locations:

- Monday, August 25, 2008, Matteson, IL - Holiday Inn, 500 Holiday Plaza Dr.
- Tuesday, August 26, 2008, Mundelein, IL - Crowne Plaza Hotel, 510 E. Route 83
- Wednesday, August 27, 2008, Barrington, IL - Barrington High School Gym, 616 W. Main St.
- Thursday, August 28, 2008, Bartlett, IL - Bartlett High School Auditorium, 701 W. Schick Rd.
- Monday, September 8, 2008, Chicago, IL - Loyola University of Chicago, Rubloff Auditorium, 25 E. Pearson St.
- Tuesday, September 9, 2008, Aurora, IL - West Aurora High School Auditorium, 1201 W. New York St.
- Wednesday, September 10, 2008, Gary, IN - Indiana University Northwest, Savannah Center, 3400 Broadway
- Thursday, September 11, 2008, Joliet, IL - Holiday Inn. 411 S. Larkin Ave.

The meeting facilities comply with the Americans with Disabilities Act. Persons who need additional special accommodations should call 1-800-347-0689 48 hours prior to the public meeting.

The same information will be presented at each meeting and will follow the schedule outlined below:

Open House – 4:00 PM – 6:00 PM

SEA and its consultant, HDR, Inc. will be available to answer questions and help members of the public review project maps and other findings of the Draft EIS analysis.

Public Meeting – 6:00 PM – 9:00 PM

SEA will make a short presentation to the public and will then be available to receive formal comments on the Draft EIS. This portion of the meeting will be held for the purpose of receiving comments. It is not intended to be a question-and-answer session. Speaker registration will be determined on a first come first serve basis by calling the hotline to pre-register in advance (1-800-347-0689) or by registering at the sign-in tables the day of the public meeting. Phone registration will end at 6 PM the day prior to the meeting. Each speaker will be allocated up to 3 minutes to present his or her comments.

Please send written comments to: Phillis Johnson-Ball, Surface Transportation Board, 395 E Street, SW, Washington, DC 20423; Attention: Environmental Filing, STB Finance Docket No. 35087. Submit electronic comments by visiting the Board's website, www.stb.dot.gov, under the heading E-Filing. Please refer to STB Finance Docket No. 35087. Court reporters will be available at the meeting for those who wish to dictate their comments instead of presenting them publicly. Comments may also be recorded at any time during the comment period on the project hotline: 1-800-347-0689.

All comments received will carry equal weight in helping to finalize the EIS and guide the Board in its decision making on this matter. ***The comment period on the Draft EIS will end on September 30, 2008.***
For further information on this proceeding, please visit the project website at www.stbfinancedocket35087, or call the toll-free information line at 1-800-347-0689. You may also visit the Board's website (www.stb.dot.gov) and look for Key Cases under Environmental Matters.

PUBLIC NOTICE

Public Notice is hereby given by the Community Development Commission of the City of Chicago (the "City") pursuant to section 5/11-74.4-4 of the Illinois Tax Increment Allocation Redevelopment Act, as amended (65ILCS 5/11-74.4-1 et seq.) (the "Act"), that the City's Department of Housing ("DOH") intends to negotiate a redevelopment agreement with Gateway to Lawndale LLC (the "Developer") pursuant to which the City intends to convey to the Developer the City-owned parcels identified below (the "Disposition Parcels"), which Disposition Parcels are located in the Midwest TIF Redevelopment Project Area (the "Area"), for the Developer's construction of affordable, for-sale single-family residences on such Disposition parcels in accordance with the New Homes for Chicago program. The Disposition Parcels shall be conveyed for $1.00 each. The Disposition Parcels are located within the Area established pursuant to the Act, and the Project is in compliance with the Midwest TIF Redevelopment Plan. The Area is generally bounded as follows:

On the north by 53rd Street, on the south by Marquette Road, on the east by Racine Avenue, and on the west by Leavitt Street.

THE CITY HEREBY INVITES ALTERNATIVE PROPOSALS FOR THE REDEVELOPMENT OF THE DISPOSITION PARCELS FOR CONSIDERATION BY THE CITY.

The documents listed below related to the Area, the Project and the Disposition Parcels are available for public inspection on or before August 11, 2008 at the offices of DOH, which are located on 2ND Floor, 33 N. LaSalle, Chicago, Illinois between the hours of 9:00 a.m. and 4:00 p.m., Monday through Friday:

(i) "63rd/Ashland Tax Increment Financing Redevelopment Project and Plan," which constitutes the City's redevelopment plan for the Area;
(ii) a term sheet showing all proposed material terms of the Redevelopment Agreement as of the date hereof;
(iii) the terms of all bids and proposals received, if any, by the City related to the Project and the redevelopment agreements; and
(iv) the terms and conditions of the New Homes for Chicago Program.

Please contact Mark Roschen at (312) 742-0854 to review these materials and for information regarding the form required, if any, for proposals submitted to the City. Proposals shall include the general plan for the redevelopment of the Disposition Parcels, the names of the party or parties making the proposal, the price offered, evidence of financial qualifications and capacity to complete said redevelopment, and the timetable for implementation. The City reserves the right to reject any and all proposals. Proposals will be received by the City at DOH's offices, which are located on 2ND Floor, 33 North LaSalle St., Chicago, Illinois, 60602, until September 10, 2008 at 2:00 p.m., at which time all alternative proposals will be opened and reviewed.

The Disposition Parcels are located at the following addresses:

NOTICE OF OPEN HOUSE/PUBLIC MEETINGS
Surface Transportation Board
Section of Environmental Analysis

On July 25, 2008, the Surface Transportation Board (Board) served the Draft Environmental Impact Statement (Draft EIS) for the proposed Canadian National Railway Company's acquisition of the Elgin, Joliet & Eastern Railway. As part of the EIS process, the Board's Section of Environmental Analysis (SEA) will hold eight public meetings to present the findings of the Draft EIS and to allow an opportunity for public comment on the document.

All open houses are 4–6 PM with public meetings from 6–9 PM. SEA will hold the public meetings on the following dates and at the following locations:

- Monday, August 25, 2008, Matteson, IL - Holiday Inn, 500 Holiday Plaza Dr.
- Tuesday, August 26, 2008, Mundelein, IL - Crowne Plaza Hotel, 510 E. Route 83
- Wednesday, August 27, 2008, Barrington, IL - Barrington High School Gym, 616 W. Main St.
- Thursday, August 28, 2008, Bartlett, IL - Bartlett High School Auditorium, 701 W. Schick Rd.
- Monday, September 8, 2008, Chicago, IL - Loyola University of Chicago, Rubloff Auditorium, 25 E. Pearson St.
- Tuesday, September 9, 2008, Aurora, IL - West Aurora High School Auditorium, 1201 W. New York St.
- Wednesday, September 10, 2008, Gary, IN - Indiana University Northwest, Savannah Center, 3400 Broadway
- Thursday, September 11, 2008, Joliet, IL - Holiday Inn. 411 S. Larkin Ave.

The meeting facilities comply with the Americans with Disabilities Act. Persons who need additional special accommodations should call 1-800-347-0689 48 hours prior to the public meeting.

The same information will be presented at each meeting and will follow the schedule outlined below:

Open House – 4:00 PM – 6:00 PM

SEA and its consultant, HDR, Inc. will be available to answer questions and help members of the public review project maps and other findings of the Draft EIS analysis.

Public Meeting – 6:00 PM – 9:00 PM

SEA will make a short presentation to the public and will then be available to receive formal comments on the Draft EIS. This portion of the meeting will be held for the purpose of receiving comments. It is not intended to be a question-and-answer session. Speaker registration will be determined on a first come first serve basis by calling the hotline to pre-register in advance (1-800-347-0689) or by registering at the sign-in tables the day of the public meeting. Phone registration will end at 6 PM the day prior to the meeting. Each speaker will be allocated up to 3 minutes to present his or her comments.

Please send written comments to: Phillis Johnson-Ball, Surface Transportation Board, 395 E Street, SW, Washington, DC 20423; Attention: Environmental Filing, STB Finance Docket No. 35087. Submit electronic comments by visiting the Board's website, www.stb.dot.gov, under the heading E-Filing. Please refer to STB Finance Docket No. 35087. Court reporters will be available at the meeting for those who wish to dictate their comments instead of presenting them publicly. Comments may also be recorded at any time during the comment period on the project hotline: 1-800-347-0689.

All comments received will carry equal weight in helping to finalize the EIS and guide the Board in its decision making on this matter. ***The comment period on the Draft EIS will end on September 30, 2008.***

For further information on this proceeding, please visit the project website at www.stbfinancedocket35087, or call the toll-free information line at 1-800-347-0689. You may also visit the Board's website (www.stb.dot.gov) and look for Key Cases under Environmental Matters.

NOTICE OF ABANDONMENT

On July 25, 2008, the United States District Court for the Northern District of Illinois, in a case entitled United States v. Narkibla Harvey, No. 05 CR 195, ordered abandonment to the United States of the following property pursuant to 41 C.F.R. § 128-48.1:

(a) one Colt .38 caliber handgun, bearing serial number 273968.

The Attorney General of the United States intends to dispose of the property. In accordance with 18 U.S.C. § 853(n)(1), any persons or entities alleging an interest in such properties must file a petition with the Court and the United States Attorney's Office, 219 South Dearborn Street, Chicago, Illinois 60604, within thirty (30) days of either the publication of this notice or receipt thereof by mail, whichever is earlier. The petition must be signed by the petitioner under penalty of perjury and must set forth:

(1) the nature and extent of the petitioner's right, title or interest in such property;

(2) the time and circumstances of the petitioner's acquisition of the right, title or interest in the property;

(3) any additional facts supporting the petitioner's claim; and

(4) the relief sought.

A hearing on the petitions may be held by the Court, notice of which shall be given to all petitioners. If you fail to file a petition to assert your right, title or interest in the above-described property, within thirty (30) days of this notice, your right, title and interest in this property shall be defaulted and forfeited to the United States. The United States then shall have clear title to the property herein described and may warrant good title to any subsequent purchaser or transferee.

Please check www.forfeiture.gov for a listing of all judicial forfeiture notices as newspaper publication of judicial forfeiture notices will be discontinued in the near future.

NOTICE OF OPEN HOUSE/PUBLIC MEETINGS

Surface Transportation Board
Section of Environmental Analysis

On July 25, 2008, the Surface Transportation Board (Board) served the Draft Environmental Impact Statement (Draft EIS) for the proposed Canadian National Railway Company's acquisition of the Elgin, Joliet & Eastern Railway. As part of the EIS process, the Board's Section of Environment Analysis (SEA) will hold eight public meetings to present the findings of the Draft EIS and to allow an opportunity for public comment of the document.

All open houses are 4–6 PM with public meetings from 6–9 PM. SEA will hold the public meetings on the following dates and at the following locations:

- Monday, August 25, 2008, Matteson, IL – Holiday Inn, 500 Holiday Plaza Dr.
- Tuesday, August 26, 2008, Mundelein, IL – Crowne Plaza Hotel, 510 E. Route 83
- Wednesday, August 27, 2008, Barrington, IL – Barrington High School Gym, 616 W. Main St.
- Thursday, August 28, 2008, Bartlett, IL – Bartlett High School Auditorium, 701 W. Schick Rd.
- Monday, September 8, 2008, Chicago, IL – Loyola University of Chicago, Rubloff Auditorium, 25 E. Pearson St.
- Tuesday, September 9, 2008, Aurora, IL – West Aurora High School Auditorium, 1201 W. New York St.
- Wednesday, September 10, 2008, Gary, IN – Indiana University Northwest, Savannah Center, 3400 Broadway
- Thursday, September 11, 2008, Joliet, IL – Holiday Inn, 411 Larkin Ave.

The meeting facilities comply with the Americans with Disabilities Act. Persons who need additional special accommodations should call 1-800-347-0689 48 hours prior to the public meeting.

The same information will be presented at each meeting and will follow the schedule outlined below:

Open House – 4:00 PM – 6:00 PM

SEA and its consultant, HDR, Inc. will be available to answer questions and help members of the public review project maps and other findings of the Draft EIS analysis.

Public Meeting – 6:00 PM – 9:00 PM

SEA will make a short presentation to the public and will then be available to receive formal comments on the Draft EIS. This portion of the meeting will be held for the purpose of receiving comments. It is not intended to be a question-and-answer session. Speaker registration will be determined on a first come first serve basis by calling the hotline to pre-register in advance (1-800-347-0689) or by registering at the sign-in tables the day of the public meeting. Phone registration will end at 6 PM the day prior to the meeting. Each speaker will be allocated up to 3 minutes to present his or her comments.

Please send written comments to: Phyllis Johnson-Ball, Surface Transportation Board, 395 E Street, SW, Washington, DC 20423; Attention: Environmental Filing, STB Finance Docket No. 35087. Submit electronic comments by visiting the Board's website, www.stb.dot.gov , under the heading E-Filing. Please refer to STB Finance Docket No. 35087. Court reporters will be available at the meeting for those who wish to dictate their comments instead of presenting them publicly. Comments may also be recorded at any time during the comment period on the project hotline: 1-800-347-0689.

All comments received will carry equal weight in helping to finalize the EIS and guide the Board in its decision making on this matter. ***The comment period on the Draft EIS will end on September 30, 2008.***

For further information on this proceeding, please visit the project website at www.stbfinancedocket35087 , or call the toll-free information line at 1-800-347-0689. You may also visit the Board's website (www.stb.dot.gov) and look for Key Cases under Environmental Matters.

American Enterprise Bank. The balance of any successful bid must be received by the Secured Party in good funds within five (5) days of the conclusion of the Sale. If the successful bidder fails to pay the balance of its successful bid within the time allotted, the initial deposit will be forfeited and the Secured Party may, at its option, sell the assets to the next highest bidder without prejudice or waiver to any rights to and remedies against the defaulting bidder. American Enterprise Bank reserves its right to adjourn the Sale to a further date and/or modify the Sale terms and conditions in its sole discretion without any further notice. Further, American Enterprise Bank reserves its right, in its sole discretion, to determine the qualifications of any bidder, including the ability of any prospective bidder to close the transaction upon the terms and conditions set forth herein. American Enterprise Bank expressly reserves the right to make a credit bid for any of the Sales Assets, based upon its security interest in such Sale Assets, at any time up to the conclusion of the auction. American Enterprise Bank's security interest shall attach to the proceeds of sale.
THE ASSETS SOLD OR TO BE SOLD ARE BEING SOLD IN AND ON AN "AS-IS, WHERE-IS" BASIS AND WITH NO EXPRESS OR IMPLIED WARRANTIES, REPRESENTATIONS, STATEMENT OF CONDITION OF ANY KIND, INCLUDING, BUT NOT LIMITED TO, WARRANTIES OF TITLE, POSSESSION, QUIET ENJOYMENT, MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR THE LIKE, AND ARE TO BE IN ACCORDANCE WITH THE TERMS AND PROVISIONS OF THIS NOTICE. For further information concerning the Sale Assets, or to arrange for an inspection of these assets, please contact attorney for Secured Party, Howard Marks, Esq., Berger, Newmark & Fenchel P.C., 303 W. Madison St., 23rd Floor, Chicago, IL, Ph.: (312) 782-5050; Fax: (312) 782-6491.

Pace reserves the right to reject any and all bids or to award in accordance with the award procedure as set forth in the Invitation for Bid and the conditions in the bid documents.
Pace, in accordance with Title VI of the Civil Rights Act of 1964, 78 Stat. 252, 42U.S. C. 2000d-4 and Title 49, Code of Federal Regulations, Subtitle A, Part 21 (non-discrimination in Federally assisted Programs of the Department of Transporta-

NOTICE OF CLASS ACTION SETTLEMENT

A class action settlement has been reached in Curtis, et al. v. Vienna Beef Ltd., a lawsuit pending in the Circuit Court of Cook County, Illinois (Case No. 07 CH 27980). In that lawsuit, the Plaintiffs allege that Defendant Vienna Beef Ltd. engaged in misleading advertising and marketing of its "natural casing" products. These products (referred to below as the "Natural Casing Products") consist of all Vienna Beef Ltd. products that have either pork/hog or sheep casings, including the following: Vienna Beef Natural Casing Jumbo Franks, Vienna Beef Natural Casing Polish Sausage, Vienna Beef Natural Casing Knockwurst, Vienna Beef Frankwurst, and Vienna Beef Natural Casing Franks. The court in the lawsuit has granted preliminary approval of the settlement and directed that this notice be published prior to considering whether to grant final approval to the settlement.

While the Defendant denies any wrongdoing, it has agreed to modify its advertising and marketing of its Natural Casing Products and to make financial benefits available to the following persons (the "Settlement Class"): All consumers residing in the United States (including the District of Columbia, territories and possessions) who have consumed and/or purchased any Vienna Beef Natural Casing Products and a) did not know that the casing on the Natural Casing Product consisted of pork/hog or sheep intestine and b) would not have consumed and/or purchased the National Casing Product if they had known the product's casing consisted of pork/hog or sheep intestine.

All members of the Settlement Class should visit www.caclawyers.com/viennasettlement.html, which contains complete information about the lawsuit and the settlement, including how Settlement Class members can submit a claim to receive money under the settlement, how to be excluded from the settlement, how to object to final approval of the settlement, and the date and location of the final approval hearing. If you don't have access to the internet or otherwise have questions about the settlement, you may write to or call Plaintiffs' attorney, Lance A. Raphael, 180 W. Washington St., Ste. 700, Chicago, IL 60602 (312) 782-5808.

Public Meeting Guide

Canadian National Railway Company and Grand Trunk Corporation Control – EJ&E West Company

STB Finance Docket No. 35087

Public Meeting Guide

for the Draft Environmental Impact Statement for the proposed Canadian National Railway Company Acquisition of the Elgin, Joliet & Eastern Railway Company

Tonight's Schedule

4 - 6 PM **Open House**
No formal presentation, informal discussions only

6 - 9 PM **Public Meeting**
Short presentation followed by oral comments

Application Overview

Proposed Action

On October 30, 2007, Canadian National (CN) filed an application with the Surface Transportation Board (Board) seeking approval to acquire the Elgin, Joliet and Eastern Railway Company (EJ&E). With the Proposed Action, the following changes are anticipated:

- Six new rail-to-rail connections between existing lines
- Addition of 19 miles of siding extension and double tracking
- Increase in use of the Kirk Yard and East Joliet Yard
- Increase in rail traffic by approximately 15 to 24 trains per day on the EJ&E rail line between Libertyville, IL, and Gary, IN
- Decrease in rail traffic on the CN rail line inside the EJ&E arc
- Elimination of CN rail traffic from the St. Charles Air Line near McCormick Place

Purpose and Need

According to CN, the three primary purposes of the Proposed Action are:

1. Improve operations in and beyond Chicago area by providing a continuous rail route around the City that links the five CN rail lines radiating out from Chicago
2. Consolidate all railcar classification work in CN-owned yards to reduce the use of the Belt Railway Company of Chicago Clearing Yards
3. Provide access to customers located on EJ&E, including steel, chemical, petrochemical, and utility industries

Key Words and Abbreviations

The following are key words or abbreviations noted in this Public Meeting Guide booklet.

Applicants:	Canadian National Railway Company and Grand Trunk Corporation (CN)
Proposed Action:	Applicants' proposed acquisition of control of Elgin, Joliet and Eastern West Company (EJ&E), use of the EJ&E rail line to connect all five CN's rail lines in Chicago, and diversion of some trains from operating inside the EJ&E arc to the EJ&E rail line
Board:	Surface Transportation Board (STB)
SEA:	Section of Environmental Analysis (an office within the Board responsible for conducting the environmental review)

Public Meeting Dates and Locations

SEA will hold 8 open house/public meetings to present the findings in the Draft Environmental Impact Statement (Draft EIS) and will invite interested parties to make oral comments. The dates, times, and locations of the public meetings are as follows:

1 **Monday, Aug. 25, 2008**
Holiday Inn
500 Holiday Plaza Dr.
Matteson, IL 60443

2 **Tuesday, Aug. 26, 2008**
Crowne Plaza Hotel
510 E. Route 83
Mundelein, IL 60060

3 **Wednesday, Aug. 27, 2008**
Barrington High School Gym
616 W. Main St.
Barrington, IL 60010

4 **Thursday, Aug. 28, 2008**
Bartlett High School Auditorium
701 W. Schick Rd.
Bartlett, IL 60103

5 **Monday, Sept. 8, 2008**
Loyola University of Chicago
Rubloff Auditorium
25 E. Pearson St.
Chicago, IL 60611

6 **Tuesday, Sept. 9, 2008**
West Aurora High School
Auditorium
1201 W. New York St.
Aurora, IL 60506

7 **Wednesday, Sept. 10, 2008**
Indiana University Northwest
Savannah Center
3400 Broadway
Gary, IN 46408

8 **Thursday, Sept. 11, 2008**
Holiday Inn
411 S. Larkin Ave.
Joliet, IL 60436

Public Meeting Format and Ground Rules

All meetings will consist of an open house followed by a public meeting. The same information will be presented at each public meeting and will follow the schedule outlined below.

OPEN HOUSE 4:00 PM – 6:00 PM

Staff from the Board and HDR, Inc. will be available to answer questions and help members of the public review project maps and other findings of the Draft EIS and analysis.

PUBLIC MEETING 6:00 PM – 9:00 PM

Staff from the Board and HDR, Inc. will make a short presentation to the public and will then be available to receive formal comments on the Draft EIS. This portion of the meeting will be held for the purpose of receiving comment. It is not a question-and-answer session.

Beginning on July 25, 2008, speaker registration will be determined on a first come, first served basis by calling the hotline to pre-register in advance (1-800-347-0689) or at the sign-in tables the day of the public meeting. Each speaker will be allocated up to 3 minutes to present her or his comments.

Mutual respect, courtesy, and patience are the meeting's guiding principles. In order to maintain an atmosphere where everyone feels comfortable and welcome, we ask that you follow the ground rules listed below:

- Displays, signs, or banners are not allowed in the meeting room or registration area.
- Please do not interrupt a speaker while he or she is speaking.
- Please remain quiet while in the audience so the court reporter can accurately hear and record comments.
- When speaking, please refrain from addressing the audience or asking for audience participation.
- Please turn off cell phones and pagers or set them to vibrate.

Public Meeting Guidelines

Procedures for speaker registration and participation are listed below. The moderator has the authority to deviate from these procedures, if needed.

1. All speakers are required to register either by calling the hotline in advance of this meeting (1-800-347-0689) or by signing up at the Speaker Registration table at this meeting.
2. A list of registered speakers will be given to the moderator and court reporter at the start of the public meeting. Speakers will be called forward based on the order in which they signed up. Federally elected officials will be moved to the top of the speakers list.
3. In order to accommodate as many speakers as possible, individuals who have spoken at another public meeting for this proceeding will be placed at the end of the speaker list.
4. Each speaker will be allotted a maximum of 3 minutes to present his or her comments. A timekeeper will alert speakers at the 2 minute mark, the 2-1/2 minute mark, and at 3 minutes.
5. Speakers are encouraged to summarize written comments rather than read them in full.
6. To allow equal opportunity for all, and to accommodate the number of people who may wish to speak, yielding time to another person will not be allowed.
7. Demonstrations will not be allowed in either the open house or the public meeting.
8. Transcripts of the public meetings will be available on the Board's website (*http://www.stb.dot.gov*) approximately two weeks after the public meetings.

In addition to speaking at the public meetings, detailed written or spoken comments on the Draft EIS may be submitted by other methods as described on page 16 of this guide. All comments received will have equal weight in the process and will receive the same level of attention. The deadline for comments on the Draft EIS is **September 30, 2008**.

Frequently Asked Questions

Found within the Executive Summary is a list of frequently asked questions about the STB, its decision-making process and authority, and the proposed acquisition. These frequently asked questions are reprinted here.

What is the Surface Transportation Board (STB or Board)?

The STB was created by the ICC Termination Act of 1995 as a successor to the Interstate Commerce Commission, and is responsible for the economic regulation of freight railroads under the Interstate Commerce Act, pursuant to 49 U.S.C. 701-727 and 10101-16106. Among its various duties, the STB reviews railroad proposals to construct and operate new rail lines, abandon unneeded rail lines, or acquire and operate other lines or other railroads.

The Board itself is a bipartisan body with 3 members who are appointed by the President and confirmed by the Senate for staggered 5-year terms. Currently (as of July 2008), Charles D. Nottingham is the Chairman of the STB, Francis P. Mulvey is the Vice Chairman, and W. Douglas Buttrey is the third member.

Within the STB, the Section of Environmental Analysis (SEA) is responsible for directing the environmental review process for matters that come before the Board, conducting independent analysis of all environmental data, and making environmental recommendations to the Board.

Overall, the STB has a staff of approximately 140 people, consisting of attorneys, economists, transportation industry analysts, engineers, auditors, environmental specialists, and support staff. Although the STB is organizationally within DOT, it operates as an independent regulatory agency.

What is the STB's process for authorizing railroad consolidations and acquisitions of control?

When 2 or more rail carriers seek to consolidate—whether through merger or common control—they must obtain prior STB approval under 49 U.S.C. 11323-25 and 49 CFR Part 1180. In the case of the proposed acquisition of the Elgin, Joliet and Eastern Railway Company (EJ&E) (a Class II railroad) by the Canadian National Railway Company and

Grand Trunk Corporation (CN) (a Class I railroad), the STB must approve the acquisition unless it finds (1) as a result of the transaction, there is likely to be substantial lessening of competition, creation of a monopoly, or restraint of trade in freight surface transportation in any region of the United States, and (2) the anti-competitive effects of the transaction outweigh the public interest in meeting significant transportation needs (49 U.S.C. 11324(d)).

After an application for STB approval is filed, the STB sets a procedural schedule that gives interested parties time to submit information on any transportation issues and for the applicant to reply. The STB also prepares environmental analyses and documentation to meet its obligations under environmental laws. The STB then considers the entire record (including all comments received on environmental or transportation issues), in deciding whether to authorize the acquisition application as proposed, deny the proposal, or approve the proposal with conditions imposed to mitigate likely competitive adverse effects or potential safety or environmental concerns.

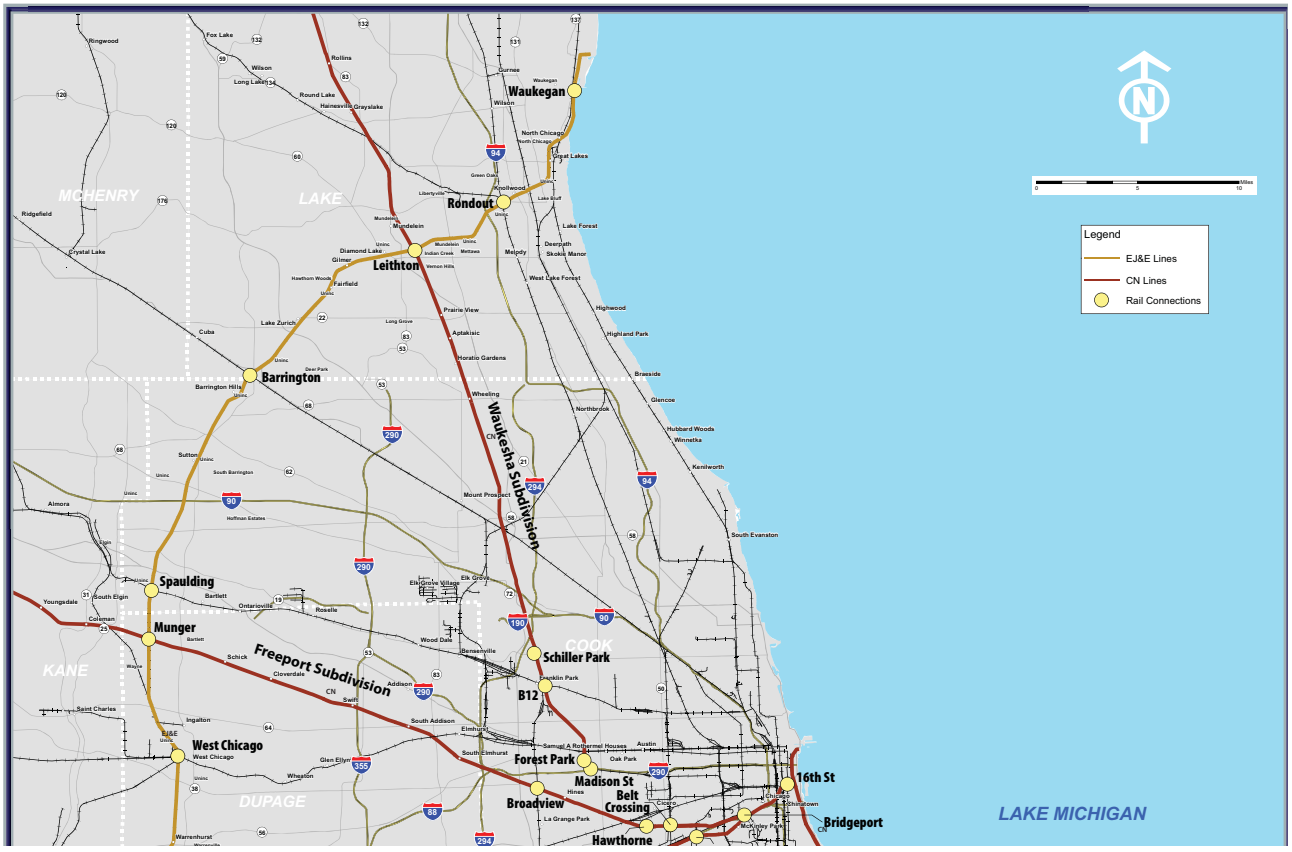
There are statutory time limits for the STB's processing of merger/control applications. Because the Board determined that the CN-EJ&E acquisition is a minor transaction, the STB's decision normally would be due within six months of the filing of the application (49 U.S.C. 11325(d)). However, the STB must also comply with the National Environmental Policy Act (NEPA), 42 U.S.C. 4321 *et seq*., in its decisionmaking and must complete the necessary environmental review process before making a final decision. Therefore, a final decision here will be issued as soon as possible after completion of the environmental review process.

What does NEPA require?

NEPA requires Federal agencies to examine the potential environmental impacts of their proposed actions, to inform the public concerning those impacts, and to consider the impacts in their decisionmaking. The purpose of NEPA is to focus the attention of the agency and the public on the likely environmental consequences of a proposed action in order to minimize or avoid potential adverse environmental impacts. However, NEPA does not mandate a particular result. Once the adverse environmental impacts have

been adequately identified and evaluated, the agency can conclude that other benefits outweigh the environmental costs.

The STB's environmental review process must comply with the requirements of the President's Council on Environmental Quality NEPA regulations (40 CFR Parts 1500–1508) and with its own NEPA-implementing regulations (49 CFR Part 1105). In the case of the proposed CN-EJ&E acquisition, the STB determined that these regulations require the preparation of a full Environmental Impact Statement (EIS)—the environmental documentation prepared in cases that have potentially significant environmental impacts.



What is the role of SEA in the NEPA process?

Under NEPA, the STB must consider the potential environmental impacts of its action before deciding whether to approve an application. SEA is the office within the STB that gathers and analyzes the environmental record in a case, prepares the NEPA documentation, and provides technical advice and recommendations to the Board on environmental matters. SEA has trained legal and environmental specialists, headed by the Chief of the Section of Environmental Analysis, Victoria Rutson.

SEA often uses "third-party contracting" to help prepare environmental documentation. Third-party contracting is a voluntary arrangement in which the applicant pays for a contractor to assist SEA by developing the environmental analyses necessary for compliance with NEPA and related environmental laws, under SEA's direction, control, and supervision. The Board's environmental rules at 49 CFR 1105.10(d) as well as the CEQ regulations at 40 Code of Federal Regulations [CFR] 1500–1508, specifically permit the use of third-party contractors approved by SEA.

The third-party contracting process provides an effective means to prepare an independent, comprehensive environmental analysis that meets the requirements of NEPA and related environmental laws. The contractors function as an extension of SEA's staff. They work under SEA's direction to collect and verify environmental information from the railroads, consulting agencies, other interested parties, and the general public; conduct unbiased environmental analysis; develop appropriate environmental criteria and

Location Map

methodologies for analyzing particular environmental issue areas; and prepare environmental documentation and mitigation options. SEA makes its own evaluation of the environmental issues and is responsible for the scope and content of the NEPA document.

What is the STB's NEPA process in a railroad acquisition case?

If an EIS is prepared, SEA first issues a notice of intent to prepare an EIS and determines the scope of work for the EIS, after providing opportunities for public participation and consultation with appropriate Federal, state, and local agencies and other government entities. SEA then prepares a Draft EIS that analyzes in detail the potential environmental impacts of the proposed acquisition, considers reasonable and feasible alternatives to the applicant's proposal, and makes recommendations for environmental mitigation. By regulation, the public has at least 45 days to comment on a Draft EIS.

SEA then issues a Final EIS that responds to the public comments, presents the results of any further environmental analysis, and incorporates final environmental mitigation recommendations. The Board then considers both the environmental record (the Draft and Final EISs and all comments received) and the record on the transportation issues to decide whether to authorize the acquisition as proposed, deny the proposal, or approve it with conditions, including environmental conditions (see 49 CFR 1105.10(a) and (f)).

What is the public's role in the NEPA process?

There are ample opportunities for public input during the NEPA process, particularly during scoping (to determine what issues should be addressed in an EIS) and in commenting on a Draft EIS. The public can submit written comments directly to the agency and/or participate in hearings or public meetings. In preparing the Final EIS, the Federal agency must take into consideration, and respond to, the comments received from the public and other parties.

For the EIS on the proposed CN-EJ&E acquisition, SEA held 14 scoping open house meetings in 7 locations in January 2008. In addition to the public scoping meetings, SEA held agency scoping meetings with Federal, state, and local agencies in Illinois and Indiana. At the Illinois

agency scoping meeting, a number of agencies asked for a greater role in development of the Draft EIS. In response, SEA established 5 stakeholder focus area groups which reviewed the methodologies and data sources used in the analysis for the Draft EIS, offered comments and suggestions, and provided additional data.

Throughout the EIS process SEA has consulted extensively with appropriate agencies, including the United States EPA and the US Fish and Wildlife Service.

In addition, SEA identified 29 communities with minority or low-income populations potentially affected by the proposed acquisition. SEA then conducted targeted and specific outreach efforts to engage these communities in the environmental review process, including direct calls to elected officials regarding the environmental review process, public scoping meetings, and meetings with local representatives.

The Board is publishing the Draft EIS and is making it available for public review and comment. SEA is also scheduling open houses/ public meetings at 8 locations in the Chicago area to give people an opportunity to learn about the Proposed Action and to present their views. SEA will continue to consult with Federal, state, and local agencies, tribes, affected communities, and all interested parties to gather and disseminate information about the proposed acquisition.

How would the CN-EJ&E acquisition affect me and my community?

If the Board were to approve the CN-EJ&E acquisition, CN would redirect its trains from its 5 rail lines in Chicago to the EJ&E rail line, thereby increasing the volume of freight rail traffic along the EJ&E rail line, with a corresponding decrease in the volume of freight rail traffic along the CN rail lines. The increase in rail traffic along the EJ&E rail line would or could result in increases in:

Delays at highway/rail at-grade crossings, including delays of school buses and emergency vehicles

- Levels of noise and vibration
- Risk of train accidents
- Air pollutant emissions
- Energy use

Although the risk is still very low, people along the EJ&E rail line would also have an increased risk of exposure to hazardous materials should an accident occur resulting in a release of such materials. Property values could decrease somewhat for residences adjacent to the EJ&E rail line. No impacts to land use and biological, water, and cultural resources or changes to population, housing, and public services are expected. Some of the potential environmental impacts could be reduced or eliminated with mitigation.

The decrease in freight rail traffic along the 5 CN rail lines would result in corresponding benefits (decreases in existing adverse impacts) to the communities along those rail lines. In addition, the proposed redirection of freight rail traffic along the EJ&E line is expected to reduce freight rail delays and rail traffic congestion within the Chicago rail system.

Would the STB impose mitigation to reduce the adverse impacts if the CN-EJ&E acquisition were approved?

As it has in other cases, the Board is very likely to impose mitigation if it were to approve the CN-EJ&E acquisition. Based on the information available to date, consultations with appropriate agencies, and extensive environmental analysis, SEA has developed recommended preliminary environmental mitigation measures to address the identified adverse environmental impacts. These measures include requiring CN to take actions to reduce emergency vehicle delays, levels of noise and vibration, and the risk of accidents, including accidents involving hazardous materials. In addition, CN has submitted 76 voluntary mitigation measures.

As an alternative to the mitigation that the Board might unilaterally impose upon applicants, SEA encourages applicants to negotiate mutually acceptable agreements with affected communities to address potential environmental impacts. Negotiated agreements can be with neighborhoods, communities, cities, counties, regional coalitions, states, or other entities. If negotiated agreements are submitted to the Board, the Board's practice is to include a condition in any final decision approval of the proposed transaction requiring applicants to comply with the terms of the negotiated agreement.

What is the Board's authority to impose mitigation?

As a government agency, the Board can only impose conditions that are consistent with its statutory authority. Any conditions the Board imposes must relate directly to the transaction before it, must be reasonable, and must be supported by the record before the Board. The Board typically does not require mitigation for existing environmental conditions, such as the effects of current railroad operations, or for land development in the vicinity of the railroads.

Will the STB consider safety issues?

Yes. Although ensuring freight rail safety is the primary responsibility of the Federal Railroad Administration, the STB also takes safety concerns into consideration in its decisionmaking. This includes vehicle safety, passenger rail safety, freight rail safety, pedestrian safety, bicycle safety, emergency vehicle response and hazardous material transportation. Safety concerns are usually raised and addressed in the STB's environmental review process.

In the future, could CN run more trains over the EJ&E rail line?

Because of physical and operational constraints on the EJ&E rail line, SEA concluded that, under the CN proposed operating plan, the EJ&E rail line would be operated at or very near to capacity. In other words, it is unlikely that the number of trains using the EJ&E rail line would be higher than that estimated by CN in the proposed operating plan. SEA conducted numerous independent rail capacity and constraint analyses before reaching this conclusion.

Has the Board ever denied a request for approval of a railroad acquisition?

Yes. The Board and its predecessor agency, the Interstate Commerce Commission, have denied some rail merger and acquisition proposals. Each case is unique, however, and the Board makes a decision in each case before it based on the full record of the transportation merits and the potential environmental impacts. Only after considering the full record does the Board make a decision to grant, to deny, or to grant with mitigating conditions.

If the Board denies the acquisition application, can CN use the EJ&E line anyway?

Yes. CN currently has trackage rights to the EJ&E rail line, giving it the right to use the EJ&E line, and could shift an increased number of trains onto the EJ&E rail line. CN would not need Board approval to exercise its existing trackage rights on the EJ&E

Where can I get more information on the pending CN-EJ&E acquisition case or other proposals currently before the STB?

Please visit the STB's website at *http://www.stb.dot.gov*. The STB maintains an electronic public docket and information system designed to permit prompt and easy public access to all filings and comments submitted to the STB and decisions issued by the agency. Information about the pending CN-EJ&E acquisition case can be found by referencing STB Finance Docket No. 35087, *Canadian National Railway Company and Grand Trunk Corporation Control-EJ&E West Company.*

SEA also maintains a project specific website at
http://www.stbfinancedocket35087.com.

Reviewing the Draft EIS

The Draft EIS can be reviewed online at *http://www.stbfinancedocket35087.com.* Hard copies of the document are available at the following locations:

The Draft EIS is also available for review on the Board's website at *http://www.stb.dot.gov*, under E-Library, Decisions & Notices, 07/25/08, FD 35087.

How Can I Submit Comments on the Draft EIS?

SEA encourages all interested parties to submit written comments on any aspect of the Draft EIS. SEA will consider all comments in preparing the Final EIS, which will include responses to all substantive comments, SEA's final conclusions on potential impacts, and SEA's final recommendations.

It is helpful to SEA to hear comment on the following:

1. A particular alternative, impact assessment, and/or draft mitigation.
2. Any incomplete or erroneous information.
3. How the proposed action would affect you.

Comments on the Draft EIS may be submitted by mail, by e-file, or by telephone. All correspondence should refer to STB Finance Docket No. 35087. The deadline for comments on the Draft EIS is **September 30, 2008**.

When submitting comments, please be as specific as possible and substantiate your concerns and recommendations.

Written comments should be mailed to:

Phillis Johnson-Ball
STB Finance Docket No. 35087
Surface Transportation Board
395 E Street, S.W.
Washington, DC 20423-0001

Environmental comments can also be filed electronically on the Board's website, *http://www.stb.dot.gov*, by clicking on the "E-FILING" link. Comments are accepted at the toll-free project information line at 1-800-347-0689. A Spanish language option is available.

PERFORATION PERFORATION

Mailing List Registration

SEA maintains an environmental distribution list composed of individuals that have expressed an interest in the Proposed Action. If you would like to be included on the distribution list and receive future mailings, please complete this form and drop it in the "Mailing List Registration" box at tonight's meeting. Please note that if you are already receiving mailings, then you are on the distribution list and returning this card is unnecessary.

Please use one character per box.

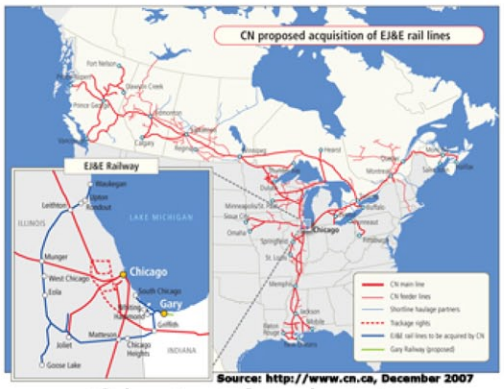
Welcome!

Welcome to the website for information regarding the Surface Transportation Board's environmental review of the proposed Canadian National Railway Company acquisition of the Elgin, Joliet and Eastern Railway Company.



Use the navigation buttons to the left to view information about the environmental study currently underway.

Project Overview

On October 30, 2007, Canadian National Railway Company (CN) (along with its U.S. subsidiary, Grand Trunk Corporation), filed an application with the Surface Transportation Board (Board) seeking to acquire EJ&E West Company, a wholly owned noncarrier subsidiary of Elgin, Joliet and Eastern Railway Company (EJ&E).

CN is one of Canada's two major railroads. It extends from Halifax, Nova Scotia, to Vancouver and Prince Rupert, British Columbia. EJ&E is a Class II railroad that currently operates over

200 miles of track in northeastern Illinois and northwestern Indiana, consisting primarily of an arc around Chicago, Illinois. This arc extends from Waukegan, Illinois, southward to Joliet, Illinois, then eastward to Gary, Indiana, and then northwest to South Chicago, Illinois, along Lake Michigan, as shown in the inset image. EJ&E provides rail service to approximately 100 customers, including steel mills, coal utilities, plastics and chemical producers, steel processors, distribution centers, and scrap processors.

Click on image for a closer view.

CN's proposed acquisition of EJ&E would shift rail traffic currently moving over CN's rail lines inside the EJ&E arc in Chicago to EJ&E rail lines, which traverse the suburbs generally to the west and south of Chicago. Rail traffic on CN lines inside the EJ&E arc would generally decrease. The decreases in rail traffic would be offset by increases in the number of trains operating on the EJ&E rail line outside of Chicago (approximately 15 to 27 more trains would operate on various segments of the EJ&E rail lines).

CN plans to construct six new rail-to-rail connections between existing rail lines and the newly acquired EJ&E line at the following locations:

1. Munger, Illinois
2. Joliet, Illinois
3. Matteson, Illinois
4. Griffith, Indiana
5. Ivanhoe, Indiana
6. Kirk Yard (Gary), Indiana

In addition to the six new rail-to-rail connections, CN plans to construct 19 miles of new sidings and double tracking at the following Illinois locations:

1. Leithton (near Libertyville)
2. Between East Siding/Eola and Walker
3. Between East Joliet and Frankfort

Applicants state three primary purposes for pursuing the Control Transaction. First, they believe the Control Transaction would improve their operations in and beyond the Chicago area by providing CN with a continuous rail route around Chicago, under applicants' ownership, that would connect the five CN lines that presently radiate from Chicago. Second, acquiring EJ&E's rail assets would make available to applicants EJ&E's Kirk Yard--an automated classification facility in Gary--as well as smaller facilities in Joliet and Whiting, IN, thus enabling applicants to consolidate car classification work at Kirk and East Joliet Yards and to reduce use of the Belt Railway Company of Chicago's (BRC) Clearing Yard. Lastly, applicants state that their system would benefit from the fact that EJ&E provides an important supply line for North American steel, chemical, and petrochemical industries, as well as for Chicago area utilities and others, which would allow applicants to develop closer and more extensive relationships

with companies in and serving those industries.

To thoroughly assess the potential environmental impacts that may result from the proposed acquisition, the Board through its Section of Environmental Analysis (SEA), will prepare an Environmental Impact Statement (EIS). Learn more about the EIS process on the Environmental Review Process page.

The following abbreviations are used throughout this website:

- **Board** - Surface Transportation Board
- **CN** - Canadian National Railway Company and Grand Trunk Corporation
- **EIS** - Environmental Impact Statement
- **EJ&E** - Elgin, Joliet and Eastern Railway Company
- **SEA** - Section of Environmental Analysis (an office within the Board)

Environmental Review Process

The National Environmental Policy Act (NEPA) process is intended to assist the Board and the public in identifying and assessing the potential environmental consequences of a proposed action before a decision on that proposed action is made. SEA is responsible for ensuring that the Board complies with NEPA and related environmental statues.

Steps of the Environmental Review Process are as follows:

- Notice of Intent
- Draft Scope of Study
- Public Scoping Meetings
- Final Scope of Study
- Draft EIS
- Public Comment
- Final EIS
- Decision

Notice of Intent

The Notice of Intent (NOI) is a document prepared by the Board that states the intent to prepare an EIS. It is mailed to all parties on the environmental distribution list and is posted on the Board's website. The NOI provides information about the next steps of the environmental review process, including the draft Scope of Study, and public scoping meetings. The NOI was published on December 21, 2007, and is available on the News & Information page.

Draft Scope of Study

A draft Scope of Study was developed for the EIS and published in the Federal Register on December 21, 2007. Public comments on the draft Scope of Study were accepted until February 15, 2008. The draft Scope of Study incorporated the environmental issues and concerns with regard to aspect's of the environmental review process. The draft Scope of Study is available on the News & Information page.

Public Scoping Meetings

Scoping is an open process to determine the range of issues that should be examined and assessed in the EIS. The scoping process included a number of public open house scoping meetings held in the affected area in mid-to late January 2008. At the meetings, members of the public had the opportunity to discuss their interests and concerns with SEA staff. Click here for information regarding the Scoping Period meetings and comment period.

Final Scope of Study

A final Scope of Study for the EIS was prepared based on the comments received on the draft Scope of Study. The final Scope of Study was published in the Federal Register on Friday, April 25 and is available on the News and Information page.

Draft EIS

SEA prepare a Draft EIS for the project. The Draft EIS addressed required environmental subjects as well as those environmental issues and concerns identified during the scoping process. The Draft EIS was served on July 25, 2008, and is available on the Draft EIS page. It contains SEA's preliminary recommendations for environmental mitigation measures.

Public Comment

The public, agencies, elected officials, and communities have the opportunity to actively participate and comment on the environmental review process. The Board invites these stakeholders to review the Draft EIS, attend public meetings, and submit comments. Comments on the Draft EIS must be **postmarked by September 30, 2008**, and can be submitted as described on the Contact Information page. The Public Involvement page provides information about the public meetings.

Final EIS

SEA will then prepare a Final EIS that will address the comments on the Draft EIS from the public and agencies.

Decision

The Board will review the Final EIS and then issue a decision on the proposed project. In reaching its decision in this case, the Board will take into account the Draft EIS, the Final EIS, public comments, and the environmental analysis and recommendations, including any environmental mitigation proposed by SEA.

The following abbreviations are used throughout this website:

- **Board** - Surface Transportation Board
- **CN** - Canadian National Railway Company and Grand Trunk Corporation
- **EIS** - Environmental Impact Statement
- **EJ&E** - Elgin, Joliet and Eastern Railway Company
- **SEA** - Section of Environmental Analysis (an office within the Board)

July 25, 2008

Re: STB Finance Docket No. 35087, Canadian National Railway Company and Grand Trunk Corporation – Control – EJ&E West Company; Issuance of Draft Environmental Impact Statement

Dear Reader:

The Section of Environmental Analysis (SEA) is pleased to provide you with your copy of the Draft Environmental Impact Statement (EIS) on the proposed acquisition of the Elgin, Joliet & Eastern Railroad by Canadian National Railway and Grand Trunk Corporation (Applicants). This Draft EIS analyzes the environmental impacts that might occur if the Applicants were to acquire and operate trains over the EJ&E Railroad, an approximately 200-mile long railroad that forms an arc from the northwest to the southeast suburbs of Chicago, approximately 40 miles outside the city. The potential environmental impacts to both the human and the natural environments that could result from the proposed acquisition are compared to the environmental impacts of continuing rail operations on the EJ&E rail line and the five CN rail lines that feed into Chicago.

The Draft EIS also sets forth SEA's preliminary recommended mitigation, Applicants' voluntary mitigation measures, and encourages mutually acceptable negotiated agreements to mitigate adverse environmental impacts should the Board approve this acquisition. The Draft EIS reflects the active participation – more than 5000 comments submitted to date – of members of the public in the Chicagoland area and beyond.

SEA invites public comment on all aspects of the Draft EIS and is providing a 60-day public comment period, which begins upon the U.S. Environmental Protection Agency's issuance of a notice of availability in the Federal Register on August 1, 2008. Comments on the Draft EIS must be postmarked by September 30, 2008. Instructions on how to submit comments, and a list of the location, dates, and times of the open house/public meetings to be held in the Chicagoland area, are attached to this letter in a separate Fact Sheet. After your review of the Draft EIS, we appreciate your comments on ways to improve our analyses, make corrections and supplement what you feel needs further work. The more specific your comments are, the better we will be able to respond to them.

After the close of the public comment period on the Draft EIS, SEA will prepare a Final EIS in response to comments on the Draft EIS. The Board will then issue a final decision, based on the entire environmental record, including the record on the transportation merits, the Draft EIS, the Final EIS, and all public and agency comments received. The Board then will decide whether to approve the proposed acquisition, deny it, or approve it with mitigating conditions, including environmental conditions.

The Draft EIS is also available for viewing and downloading via the Board's Web site at http://www.stb.dot.gov, under "E-Library," then under "Decisions & Notices," beneath the date "7/25/08."

For further information on the proceeding, please visit the project web site at www.stbfinancedocket35087.com or call the toll-free information line at 1-800-347-0689. You may also visit the Board's website (www.stb.dot.gov) and look for Key Cases under Environmental Matters.

SEA has distributed the Draft EIS widely for public review and comment. Approximately 5,000 copies of the Draft EIS on compact discs have been distributed to all parties on SEA's environmental distribution list, which includes interested Federally recognized tribes, key governmental agencies, elected officials, and persons expressing an interest in receiving a copy of the Draft EIS or participating in the environmental review process for this proceeding. SEA has also distributed the Draft EIS to all parties of record (official participants), as well as making additional print copies of the Draft EIS available for review in 49 libraries throughout the Study Area.

SEA appreciates the efforts of all interested parties who have participated in this environmental review to date. We look forward to receiving your comments.

Sincerely,

Victoria J. Rutson
Chief
Section of Environmental Analysis

Public Involvement

YOUR INPUT IS IMPORTANT!

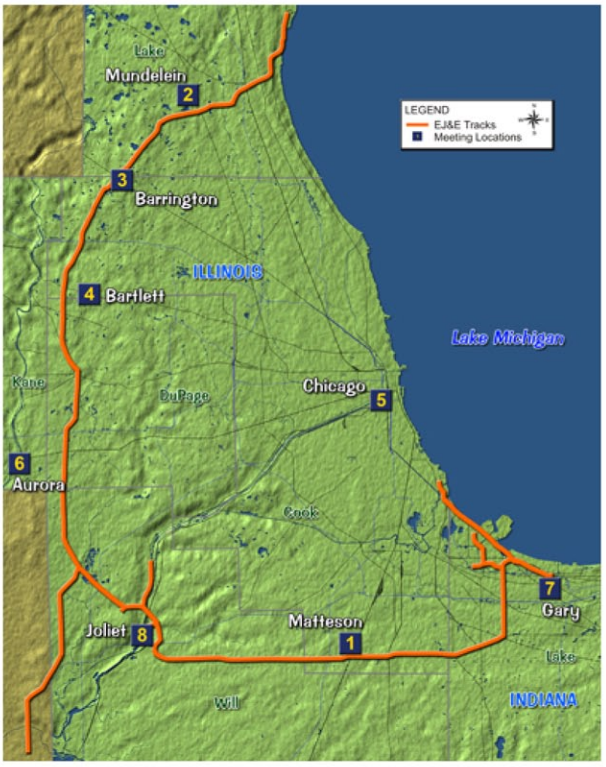
Comments provided by the public helps the Board complete the Final EIS.

What is the purpose of this website?

This website is intended to provide necessary information to the public and to encourage all interested parties to participate in the EIS process. This website also provides guidance on how to submit comments (see the Contact Information page).

When can I get involved?

SEA appreciates and desires the public to be actively involved in the environmental review process. In January, SEA hosted a series of public meetings and received public comments during the Scoping Period. With the release of the Draft EIS, SEA is once again soliciting public comment and hosting public meetings. Information about the Draft EIS public involvement is presented here. Click here for information regarding the Scoping Period meetings and comment period.



When will the public meetings be held?

Beginning on August 25, 2008, SEA will host **eight public meetings** throughout the Chicagoland area to present the findings of the Draft EIS and receive public comments. Each public meeting will offer an informal open house segment from 4:00 to 6:00 PM, followed by a formal public meeting from 6:00 to 9:00 PM. At the beginning of each formal public meeting segment, SEA will give a brief overview of its findings in the Draft EIS and will invite interested parties to make oral comments and/or submit written comments. SEA will have a transcriber present to record the oral comments in either English or Spanish. The dates and locations of the public meetings are shown below:

Ref No.	Date	Location

Click on a number for a detailed map.

1	Monday August 25, 2008	Holiday Inn Hotel 500 Holiday Plaza Drive Matteson, IL 60443
2	Tuesday August 26, 2008	Crowne Plaza Chicago North Shore 510 E Route 83 Mundelein, IL 60060
3	Wednesday August 27, 2008	Barrington High School 616 W Main Street Barrington, IL 60010
4	Thursday August 28, 2008	Bartlett High School 701 Schick Road Bartlett, IL 60103
5	Monday September 8, 2008	Loyola University Rubloff Auditorium 25 E Pearson Chicago, IL 60611
6	Tuesday September 9, 2008	West Aurora High School 1201 W New York Street Aurora, IL 60506
7	Wednesday September 10, 2008	Indiana University Northwest Auditorium 3400 Broadway Gary, IN 46408
8	Thursday September 11, 2008	Holiday Inn Hotel 411 S Larkin Avenue Joliet, IL 60436

Public Meeting Format and Ground Rules

All meetings will consist of an open house followed by a public meeting. The same information will be presented at each public meeting and will follow the schedule outlined below.

Open House 4:00 PM - 6:00 PM

Staff from the Board and HDR, Inc. will be available to answer questions and help members of the public review project maps and other findings of the Draft EIS and analysis.

Public Meeting 6:00 PM - 9:00 PM

Staff from the Board and HDR, Inc. will make a short presentation to the public and will then be available to receive formal comments on the Draft EIS. This portion of the meeting will be held for the purpose of receiving comment. It is not a question-and-answer session.

Beginning on July 25, 2008, speaker registration will be determined on a first come, first served basis by calling the hotline to pre-register in advance (1-800-347-0689) or at the sign-in tables the day of the public meeting. Each speaker will be allocated up to 3 minutes to present her or his comments. Phone registration for each meeting will end at 6PM the day prior to the meeting. A list of registered speakers can be found here. The list does not indicate speaker order, only that speaker registration was received. This list is updated daily.

Mutual respect, courtesy, and patience are the meeting's guiding principles. In order to maintain an atmosphere where everyone feels comfortable and welcome, we ask that you follow the ground rules listed below:

- Displays, signs, or banners are not allowed in the meeting room or registration area.
- Please do not interrupt a speaker while he or she is speaking.
- Please remain quiet while in the audience so the court reporter can accurately hear and record comments.
- When speaking, please refrain from addressing the audience or asking for audience participation.
- Please turn off cell phones and pagers or set them to vibrate.

Public Meeting Guidelines

Procedures for speaker registration and participation are listed below. The moderator has the authority to deviate from these procedures, if needed.

1. All speakers are required to register either by calling the hotline in advance of the meeting **(1-800-347-0689)** or by signing up at the Speaker Registration table at the meeting.
2. A list of registered speakers will be given to the moderator and court reporter at the start of the public meeting. Speakers will be called forward based on the order in which they signed up. Federally elected officials will be moved to the top of the speakers list.
3. In order to accommodate as many speakers as possible, individuals who have spoken at another public meeting for this proceeding will be placed at the end of the speaker list.
4. Each speaker will be allotted a maximum of 3 minutes to present his or her comments. A timekeeper will alert speakers at the 2 minute mark, the 2-1/2 minute mark, and at 3 minutes.
5. Speakers are encouraged to summarize written comments rather than read them in full.
6. To allow equal opportunity for all, and to accommodate the number of people who may wish to speak, yielding time to another person will not be allowed.
7. Demonstrations will not be allowed in either the open house or the public meeting.
8. Transcripts of the public meetings will be available on the Board's website (*http://www.stb.dot.gov*) approximately two weeks after the public meetings.

In addition to speaking at the public meetings, detailed written or spoken comments on the Draft EIS may be submitted by other methods as described on the Contact Information page. All comments received will have equal weight in the process and will receive the same level of attention. The deadline for comments on the Draft EIS is **September 30, 2008**.

The following abbreviations are used throughout this website:

- **CN** - Canadian National Railway Company and Grand Trunk Corporation
- **EJ&E** - Elgin, Joliet and Eastern Railway Company
- **Board** - Surface Transportation Board
- **SEA** - Section of Environmental Analysis (an office within the Board)
- **EIS** - Environmental Impact Statement

Scoping Period Meetings and Comment Summary

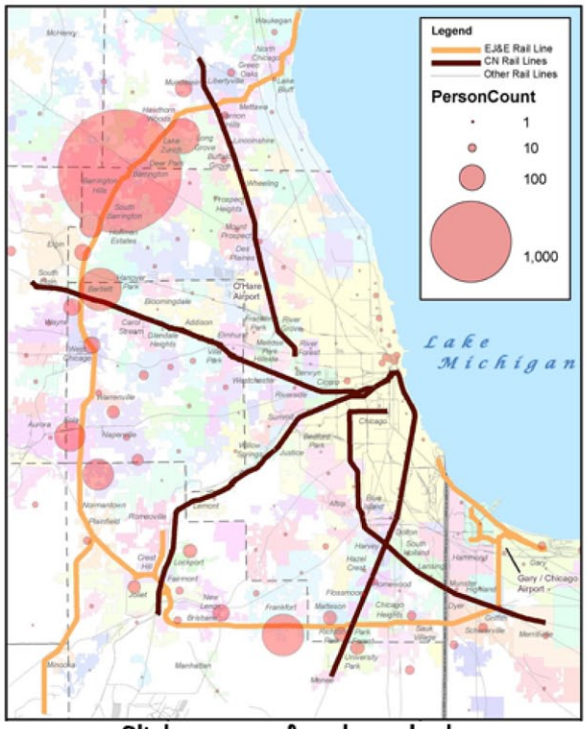
When were the scoping meetings held?

Scoping meetings were held January 8, 9, 10, 15, 16, 17, and 22, 2008, in Mundelein, Barrington, Joliet, Matteson, Gary, West Chicago, and Chicago respectively. All scoping meetings were held in an open house format, with the same information presented during each meeting.

In keeping with the open house format of the scoping meetings, there were no formal presentations made by agency representatives. Rather, SEA staff was available to answer questions and receive comments individually. Interested persons asked questions about the proposed acquisition and the Board's environmental review process, and discussed the potential environmental effects of the proposed acquisition with project team members.

Information on this study was presented on a series of boards (30" x 40"). These boards are available for viewing (click on links below) and include:

- Welcome
- What is the Purpose of This Open House Scoping Meeting?
- Who is Hosting This Meeting?
- What is the Proposed Acquisition?/What is the Purpose of the Acquisition?
- Project Location Map
- What Changes are Anticipated from the Acquisition?
- Communities Along Affected Rail Line Segments
- Anticipated Changes to Rail Traffic Volumes
- What Process Will SEA Follow?
- What Issues did the Draft Scope of Study Identify?
- How Do I Submit Comments?



A series of flip charts were used to illustrate proposed track improvements at six locations along the EJ&E rail line. These charts are available for viewing (click on links below) and include:

- Project Track Improvements - Proposed Rail Connection on EJ&E Locations

- Project Track Improvements - Munger, IL
- Project Track Improvements - Joliet, IL
- Project Track Improvements - Matteson, IL
- Project Track Improvements - Griffith, IN
- Project Track Improvements - Ivanhoe, IN
- Project Track Improvements - Kirk Yard, IN

What comments were received during the Scoping Period?

3,683 comments on the Draft Scope of Study were submitted from members of the public, government officials, businesses, and other interested stakeholders. The map below shows the distribution of comments received within the Chicago metro area. Additionally, comment summary reports for some of the larger distributions of comments are provided.

Click on map for closer look.

Information Request

SEA has made several information requests from the applicants in regard to the proposed Canadian National Railway Company acquisition of the Elgin, Joliet and Eastern Railway Company. This information will assist SEA in conducting the environmental review of the proposed acquisition required by the National Environmental Policy Act. As the review proceeds, further information requests may be necessary to ensure the study is conducted thoroughly. These information requests and the responses from the applicants are available below.

To download the file (PDF or ZIP), right mouse click on the link and choose Save Target As..., then save the file to your computer.

The Board and SEA

For more information on the Board and SEA, please click here (PDF 31KB).

Find information requested of the applicants from the Board on the Information Request Page.

Announcements and News Releases

July 25, 2008 - The Board released the Draft EIS. This document is available on the Draft EIS page. The comment period for the Draft EIS will close September 30, 2008. To help inform stakeholders of the contents of the Draft EIS, eight public meetings will be held during the comment period. See the Public Involvement page for information regarding public meetings and the Contact Information page for information regarding submitting comments on the Draft EIS.

April 25, 2008 - The Board released the Final Scope of Study. This document was published in the Federal Register and incorporates comments received on the Draft Scope of Study. The Board issued a clarification to the Final Scope of Study on Monday, April 28, 2008. View the addendum to the Final Scope of Study here (PDF 35KB) and the new version of the Final Scope of Study here (PDF 88KB).

April 23, 2008 - The Board released Decision No. 9 (PDF 72KB) regarding the six proposed connections. Illustrations of the proposed track improvements are available on the Scoping Period Meetings and Comment Summary page.

February 15, 2008 - The deadline for comments on the draft Scope of Study has closed. The next opportunity for public review and comment will occur after the release of the Draft EIS.

January 27, 2008 - The Board extended the comment period of the draft Scope of Study for the EIS to February 15, 2008. See the postcard that announced the extension.

December 12, 2007 - This press release (PDF 18KB) from the Board is regarding public

involvement and the review process for the project. This document contains information about what procedures will be followed for reviewing the impacts of the proposed acquisition and how public input will play a role in that process.

Project Information

On January 8, 9, 10, 15, 16, 17, and 22, 2008, public open house meetings were conducted in Mundelein, Barrington, Joliet, Matteson, Gary, West Chicago, and Chicago (see map to the left for meeting locations). Over 2,000 interested citizens attended the meetings. A project fact sheet (PDF 31KB) prepared for the public scoping meetings provided a quick overview of the proposed acquisition and explained how to submit comments.

On December 21, 2007, the Board issued a Notice of Intent (NOI) (PDF 52KB) to prepare an EIS and a draft Scope of Study for the project, which gives general project information and information about the first set of public meetings as well as outlines the process that will be followed in the environmental review. The NOI also includes information about the environmental aspects that will be considered in the EIS. The public meetings will present general information about the project and allow the public to submit comments on the study that will be incorporated in the final Scope of Study for the project. You can submit comments on the draft Scope of Study by using the Contact Information page.

On November 27, 2007, the Board issued Decision No. 2: Notice of Acceptance of Primary Application and Related Filings; Issuance of Procedural Schedule (PDF 129KB), in which

the Board accepts CN's application for acquisition and adopts a procedural schedule for consideration of the application.

Frequently Asked Questions

On October 30, 2007, Canadian National Railway Company and Grand Trunk Corporation (CN) filed an application with the Surface Transportation Board seeking the Board's approval to acquire control of EJ&E West Company and to use the EJ&E main rail line to connect all 5 of CN's rail lines in the Chicago, Illinois Metropolitan Area. The EJ&E main line, located in northeastern Illinois and northwestern Indiana, extends in an arc around Chicago, Illinois. The following addresses frequently asked questions about the STB, its decision-making process and authority, and the proposed acquisition.

- What is the Surface Transportation Board (STB or Board)?
- What is the STB's process for authorizing railroad consolidations and acquisitions of control?
- What does NEPA require?
- What is the role of SEA in the NEPA process?
- What is the STB's NEPA process in a railroad acquisition case?
- What is the public's role in the NEPA process?
- How would the CN-EJ&E acquisition affect me and my community?
- Would the STB impose mitigation to reduce the adverse impacts if the CN-EJ&E acquisition were approved?
- What is the Board's authority to impose mitigation?
- Will the STB consider safety issues?
- In the future, could CN run more trains over the EJ&E rail line?
- Has the Board ever denied a request for approval of a railroad acquisition?
- If the Board denies the acquisition application, can CN use the EJ&E line anyway?
- Where can I get more information on the pending CN-EJ&E acquisition case or other proposals currently before the STB?
- How can I submit comments on the Draft EIS?

What is the Surface Transportation Board (STB or Board)?
The STB was created by the ICC Termination Act of 1995 as a successor to the Interstate Commerce Commission, and is responsible for the economic regulation of freight railroads under the Interstate Commerce Act, pursuant to 49 U.S.C. 701-727 and 10101-16106. Among its various duties, the STB reviews railroad proposals to construct and operate new rail lines, abandon unneeded rail lines, or acquire and operate other lines or other railroads.

The Board itself is a bipartisan body with 3 members who are appointed by the President and confirmed by the Senate for staggered 5-year terms. Currently (as of July 2008), Charles D. Nottingham is the Chairman of the STB, Francis P. Mulvey is the Vice Chairman, and W. Douglas Buttrey is the third member.

Within the STB, the Section of Environmental Analysis (SEA) is responsible for directing the environmental review process for matters that come before the Board, conducting independent analysis of all environmental data, and making environmental recommendations to the Board.

Overall, the STB has a staff of approximately 140 people, consisting of attorneys, economists, transportation industry analysts, engineers, auditors, environmental specialists, and support staff. Although the STB is organizationally within DOT, it operates as an independent regulatory agency. (Back to top)

What is the STB's process for authorizing railroad consolidations and acquisitions of control?

When 2 or more rail carriers seek to consolidate – whether through merger or common control – they must obtain prior STB approval under 49 U.S.C. 11323-25 and 49 CFR Part 1180. In the case of the proposed acquisition of the Elgin, Joliet and Eastern Railway Company (EJ&E) (a Class II railroad) by the Canadian National Railway Company and Grand Trunk Corporation (CN) (a Class I railroad), the STB must approve the acquisition unless it finds (1) as a result of the transaction, there is likely to be substantial lessening of competition, creation of a monopoly, or restraint of trade in freight surface transportation in any region of the United States, and (2) the anti-competitive effects of the transaction outweigh the public interest in meeting significant transportation needs (49 U.S.C. 11324(d)).

After an application for STB approval is filed, the STB sets a procedural schedule that gives interested parties time to submit information on any transportation issues and for the applicant to reply. The STB also prepares environmental analyses and documentation to meet its obligations under environmental laws. The STB then considers the entire record (including all comments received on environmental or transportation issues), in deciding whether to authorize the acquisition application as proposed, deny the proposal, or approve the proposal with conditions imposed to mitigate likely competitive adverse effects or potential safety or environmental concerns.

There are statutory time limits for the STB's processing of merger/control applications. Because the Board determined that the CN-EJ&E acquisition is a minor transaction, the STB's decision normally would be due within six months of the filing of the application (49 U.S.C. 11325(d)). However, the STB must also comply with the National Environmental Policy Act (NEPA), 42 U.S.C. 4321 *et seq*., in its decisionmaking and must complete the necessary environmental review process before making a final decision. Therefore, a final decision here will be issued as soon as possible after completion of the environmental review process. (Back to top)

What does NEPA require?
NEPA requires Federal agencies to examine the potential environmental impacts of their proposed actions, to inform the public concerning those impacts, and to consider the impacts in their decisionmaking. The purpose of NEPA is to focus the attention of the agency and the public on the likely environmental consequences of a proposed action in order to minimize or avoid potential adverse environmental impacts. However, NEPA does not mandate a particular result. Once the adverse environmental impacts have been adequately identified and evaluated, the agency can conclude that other benefits outweigh the environmental costs.

The STB's environmental review process must comply with the requirements of the President's Council on Environmental Quality NEPA regulations (40 CFR Parts 1500-1508) and with its own NEPA-implementing regulations (49 CFR Part 1105). In the case of the proposed CN-EJ&E acquisition, the STB determined that these regulations require the preparation of a full Environmental Impact Statement (EIS) -- the environmental documentation prepared in cases that have potentially significant environmental impacts. (Back to top)

What is the role of SEA in the NEPA process?
Under NEPA, the STB must consider the potential environmental impacts of its action before deciding whether to approve an application. SEA is the office within the STB that gathers and analyzes the environmental record in a case, prepares the NEPA documentation, and provides technical advice and recommendations to the Board on environmental matters. SEA has trained legal and environmental specialists, headed by the Chief of the Section of Environmental Analysis, Victoria Rutson.

SEA often uses "third-party contracting" to help prepare environmental documentation. Third-party contracting is a voluntary arrangement in which the applicant pays for a contractor to assist SEA by developing the environmental analyses necessary for compliance with NEPA and related environmental laws, under SEA's direction, control, and supervision. The Board's environmental rules at 49 CFR 1105.10(d) as well as the CEQ regulations at 40 Code of Federal Regulations [CFR] 1500 – 1508, specifically permit the use of third-party contractors approved by SEA.

The third-party contracting process provides an effective means to prepare an independent, comprehensive environmental analysis that meets the requirements of NEPA and related environmental laws. The contractors function as an extension of SEA's staff. They work under SEA's direction to collect and verify environmental information from the railroads, consulting agencies, other interested parties, and the general public; conduct unbiased environmental analysis; develop appropriate environmental criteria and methodologies for analyzing particular environmental issue areas; and prepare environmental documentation and mitigation options. SEA makes its own evaluation of the environmental issues and is responsible for the scope and content of the NEPA document. (Back to top)

What is the STB's NEPA process in a railroad acquisition case?
If an EIS is prepared, SEA first issues a notice of intent to prepare an EIS and determines the scope of work for the EIS, after providing opportunities for public participation and consultation with appropriate Federal, state, and local agencies and other government entities. SEA

then prepares a Draft EIS that analyzes in detail the potential environmental impacts of the proposed acquisition, considers reasonable and feasible alternatives to the applicant's proposal, and makes recommendations for environmental mitigation. By regulation, the public has at least 45 days to comment on a Draft EIS.

SEA then issues a Final EIS that responds to the public comments, presents the results of any further environmental analysis, and incorporates final environmental mitigation recommendations. The Board then considers both the environmental record (the Draft and Final EISs and all comments received) and the record on the transportation issues to decide whether to authorize the acquisition as proposed, deny the proposal, or approve it with conditions, including environmental conditions (see 49 CFR 1105.10(a) and (f)). (Back to top)

What is the public's role in the NEPA process?
There are ample opportunities for public input during the NEPA process, particularly during scoping (to determine what issues should be addressed in an EIS) and in commenting on a Draft EIS. The public can submit written comments directly to the agency and/or participate in hearings or public meetings. In preparing the Final EIS, the Federal agency must take into consideration, and respond to, the comments received from the public and other parties.
